Document Revision History

Date	Version	Description
05-Dec-2006	1.0.0	Mail Ballot Draft
February 2007	1.0.0	Approved Standard Specification Officially approved.
27-Mar-2007	1.1.0	Editorial Change Number 1, Clause 1.2, fourth paragraph remove 's' from "turns". (Motion 4) Editorial Change Number 2, Remove the last two sentences from the Scaling Tables section. (Motion 5) Editorial Change Number 3, change wording from "current revision of version 1 of the TPC Pricing Specification" to "effective version of the TPC Pricing Specification". (Motion 6) Editorial Change Number 4, Update pseudo-code in Trade-Order frame 3 to include the

		hs_qty no rows returned situation. (Motion 7)
03-Apr-2007	1.1.0	Editorial Change Number 5, Clarify Market-Watch pseudo-code. (Motion 11) Editorial Change Number 6, editorial fixes for spaces and underscores and correctly numbering things in Data-Maintenance, also Database Footprint corrections. (Motion 12)
10-Apr-2007	1.1.0	Editorial Change Number 7 clarifies the definition of "Application". (Motion 14)
19-Apr-2007	1.1.0	Officially approved.
26-Apr-2007	1.2.0	Editorial Change Number 8 clarifies clause 2.2.3.4 which is about whether nulls are allowed in columns. (Motion 24)
02-May-2007	1.2.0	Editorial Change Number 9 clarifies clause 3.2.1.1. A Frame may not use knowledge of EGen's data generation methods. (Motion 27) Editorial Change Number 10, add "Profile" as a defined term and make changes to use the new defined term. (Motion 28) Editorial Change Number 11, in clause 3.3 change "profiles" to "characteristics" to avoid ambiguity with the defined term. (Motion 29) Editorial Change Number 12, in clause 1.1, deletes clause 3.2.1.3 text from the definition of a Database Footprint. (Motion 30) Editorial Change Number 13, clarify step 4 in clause 6.4.3.2. (Motion 31) Editorial Change Number 14, in clause 2.2.5.5 removes the text in parenthesis from the description of the SE_AMT column. (Motion 34) Editorial Change Number 15, add text "during a Test Run" after "by the database" in clauses 2.2.3.1, 2.2.3.2, 2.2.3.3. (Motion 35) Editorial Change Number 16, change the second sentence of clause 2.3.3.3. (Motion 36) Editorial Change Number 17, in clause 10.2.2.15 correct the reference to clause 2.3.6 not clause 2.3.8. (Motion 37) Editorial Change Number 18, add a comment to clause 10.2.2.20 saying no check is required for clause 2.4.2. (Motion 38) Editorial Change Number 19, in clause 3.3.2.4 replace "customer" with "customer account". (Motion 39) Editorial Change Number 20 clarifies the wording in clause 10.2.5.11. (Motion 41) Editorial Change Number 21 adds the wording "unless otherwise directed by an auditor" to clause 6.6.2.3. This wording allows sponsors to run database check code for the auditor and allows the sponsor to run isolation tests. (Motion 47)
08-May-2007	1.2.0	Editorial Change Number 22, clarification of the wording used to describe some of the Frames in Trade-Lookup and Trade-Update. (Motion 49)
23-May-2007	1.2.0	Editorial Change Number 23, Boolean and LIFO clarifications (Motion 55)
30-May-2007	1.2.0	Editorial Change Number 24, roll_it_back changes (Motion 57) Editorial Change Number 25, typos and growth table fix (Motion 58) Editorial Change Number 26, isolation test changes (Motion 59) Editorial Change Number 27, clarification of the term "table" (Motion 60)
04-Jun-2007	1.2.0	Editorial Change Number 28, changes to clauses 4.4.1.1 and 10.2.4.11 wording (Motion 63) Editorial Change Number 29, new clause 2.3.11 for User-Defined Objects (Motion 64)
06-Jun-2007	1.2.0	Editorial Change Number 30 clarifies when consistency tests need to be run and what tests should be run. (Motion 66) Editorial Change Number 31, change title of clause 6.4 and 6.4.2, expand opening paragraph of clause 6.4.2, remove constant TradeLookupFrame4MaxRows from the table in clause 6.4.2 add a comment 2 to clause 3.2.1.1. (Motion 67) Editorial Change Number 32, change the isolation tests in clause 7.4.2 to use transaction parameter names instead of table column names. (Motion 68) Editorial Change Number 33, remove hard-coded "CMPT" from frames 2 and 3 in Trade-Lookup and Trade-Update, make the necessary Database-Footprint changes. (Motion 69)
12-Jun-2007	1.2.0	Editorial Change Number 34, Include the contents of the TRADE_TYPE and STATUS_TYPE tables in the specification. (Motion 72) Editorial Change Number 36, move clause 9.4.4.1 to clause 9.4.5.5. (Motion 74)

		<p>Editorial Change Number 37, accept the changes to the Numerical Quantities reporting requirements as shown in DataMaintRespTimeTrish.doc (Motion 75)</p> <p>Editorial Change Number 40, clarify the description of Market-Feed Frame 1 in clause 3.3.3.3 (Motion 79)</p> <p>Editorial Change Number 41, add select “first 3 rows” to the pseudo-code for Trade-Lookup and Trade-Update frames when we select from the TRADE_HISTORY table. (Motion 80)</p> <p>Editorial Change Number 42, change the Market-Feed Frame 1 pseudo-code to use distinct variable names (Motion 82)</p> <p>Editorial Change Number 44, add a comment to clause 6.6.5.3 to clarify the checkpoint requirements (Motion 85).</p> <p>Editorial Change Number 45, apply several editorial changes from the auditors (Motion 86)</p> <p>Editorial Change Number 46, change table to TPC-E table in clause 2.3.4 (Motion 87)</p> <p>Editorial Change Number 47, change table to TPC-E table in clause 2.3.5 (Motion 88)</p> <p>Editorial Change Number 48, move clause 6.4.2 limit constants table to clause 3.2.1.1 (Motion 89)</p>
15-Jun-2007	1.3.0	<p>Updated TPC Membership table with BEA and EnterpriseDB</p> <p>Editorial Change Number 35, add clause 6.2.5 Driver Reporting Requirements. Move clause 9.3.4.1 to clause 9.3.6.1. Change the reference in the new clause 9.3.6.1 to reference the new clause 6.2.5 instead of clause 4.1.3. (Motion 73)</p> <p>Editorial Change Number 38, add definition for “Database Metadata” to clause 1.1 (Motion 77).</p> <p>Editorial Change Number 39, clean up the reference to “Metadata” and use the newly defined term “Database Metadata” (Motion 78).</p> <p>Editorial Change Number 43, change Market-Watch Frame 1 pseudo-code. Remove the last “else” “rollback transaction”. Move the “commit transaction” outside of the “if (status!= bad_input_data)” check so that the commit is unconditional. (Motion 84)</p>
28-Aug-2007	1.3.0	<p>Change Number 49, clarify clause 6.6.2.1 so that measured runs do not have to be on a freshly restored database (Motion 99).</p> <p>Another Change Number 49, add wording to clause 6.7.4.2 to define the level of precision required for the input standard deviation (Motion 101).</p> <p>Change Number 51 - fix various typos (Motion 105).</p> <p>Change Number 52 and part of Change Number 50, add wording to appendix A.6.4 to document the #define flags to use to change the date/ time format (Motion 107 and Motion 103).</p> <p>Change Number 53 - change Trade-Result to return the load unit number (Motion 108).</p> <p>Change Number 54 – clarify clause 10.2.8.2 and clause 10.2.8.3 so that the auditor just has to check that the files that are expected are in the Supporting Files but does not have to verify every file is correct (Motion 109).</p> <p>Change Number 55 – change bullet 3 of Clause 7.5.6.7 to say “one or more” instead of “one” (Motion 110).</p> <p>Change Number 56 – in clause 10.2.2.14 change “table” to “TPC-E table” to match clause 2.3.5 (Motion 111).</p> <p>Change Number 57 – change comment 2 of Clause 7.5.5.2 (Motion 112).</p> <p>Change Number 58 – replace clause 10.2.5.14 and use Sustainable performance rather than Steady state (Motion 114).</p> <p>Change Number 59 – delete the last sentence of Clause 10.2.5.2. Change the reference in Clause 10.2.5.2 to Clause 6.6.2.2. Change the reference in Clause 10.2.5.3 to Clause 6.6.1.1 (Motion 115).</p> <p>Change Number 60 – change the definition of Dispatch Time (Motion 118).</p> <p>Change Number 61 – clarify Clause 6.6.2.3 wording, renumber Clause 10 and clarify what was clause 10.2.5.13 (Motion 120)</p> <p>Change Number 62 – remove the tables listed in parenthesis from Clause 6.6.6.2 (Motion 121).</p> <p>Change Number 63 – change comment 2 of Clause 8.2.1 (Motion 122).</p> <p>Change Number 64 – replace clause 7.5.5.4 with new Redundancy Level wording (Motion 124).</p>

		<p>Change Number 65 – delete Clause 9.3.7.3 and modify Clause 9.3.7.2 (Motion 125).</p> <p>Change Number 66 – correct the reference in Clause 10.2.5.4 to point to Clause 6.3 (Motion 126).</p> <p>Change Number 67 – change the wording of Clause 10.2.5.19 (Motion 127).</p> <p>Change Number 68 – delete Clause 10.2.4.8 (Motion 129).</p> <p>Change Number 69 – change the definition of the Boolean data-type (Motion 130).</p> <p>Change Number 70 – in Clause 7.5 replace the word “deemed” with the word “defined” (Motion 131).</p>
31-Aug-2007	1.3.0	<p>Change Number 71 – fix the style of Clause 7.4.2.4 step 7 (Motion 134).</p> <p>Change Number 72 – part 1 of clarifying field / attribute / column (Motion 135).</p> <p>Change Number 73 – change diagrams to make them more readable on a black and white print out (Motion 136).</p> <p>Change Number 74 – clarify CE Partitioning (Motion 137).</p>
05-Sep-2007	1.3.0	<p>Change Number 75 – clarify isolation test descriptions (Motion 140).</p> <p>Change Number 76 – clarify old clause 10.2.5.15 (now clause 10.6.14) (motion 141).</p>
17-Sep-2007	1.4.0	<p>Changed member's list to include Exasol.</p> <p>Change Number 77 – part 2 of clarifying field / attribute / column (Motion 148).</p> <p>Change Number 78 – drop third bullet in clause 6.6.4.2 (Motion 160)</p>
25-Sep-2007	1.4.0	Change Number 79 – clarify Referential Integrity requirements (Motion 166).
02-Oct-2007	1.4.0	Change Number 80 – clarify the term connector in clause 4.4.1.3 (Motion 170).
17-Oct-2007	1.4.0	Change Number 81 – in clause 8.2, clarify what storage may be used to meet the 60-Day space requirements (Motion 173).
07-Nov-2007	1.4.0	Editorial cleanup of headings to be consistent. Added the word “Transaction” to the headings in Clauses 3.3.2.2 and 3.3.3.2.
14-Nov-2007	1.4.0	Change Number 82 – clarify 5% or 8-hour growth rate wording by adding a comment to the Fixed Space definition in clause 6.6.6.2 (Motion 181).
27-Nov-2007	1.4.0	Change Number 83 – change appendix A.6.4 to include #define for Booleans (Motion 184).
03-Dec-2007	1.4.0	<p>Change Number 84 – Editorial change to 10.2.14 (Motion 186).</p> <p>Change Number 85 – Clarify third sentence of Clause 2.6.1.1 (Motion 188).</p> <p>Change Number 86 – Clarify the definition of Growing Space (Motion 189).</p> <p>Change Number 87 – Add Clause 9.3.5.5 to add reporting requirements for the building of EGen Objects (Motion 190).</p>
13-Dec-2007	1.5.0	<p>Changed member's list to include ParAccel and to change NCR-Teradata to just Teradata.</p> <p>Change Number 88 – changes to Business Recovery Time (Motion 191).</p>
13-Feb-2008	1.5.0	<p>Fixed cross references in Application Recovery Time and Business Recovery Time definitions.</p> <p>Change Number 89 – Add a new clause 5.7.3 to specify what the DBMS should do if EGenLoader generates an empty string (Motion 206).</p> <p>Change Number 90 – Clarify step 8 in clause 7.5.6.8 (Motion 212).</p>
27-Feb-2008	1.5.0	<p>Change Number 91 – add comment 3 to clause 3.1.2.3 saying that select for update is allowed when the Database Footprint says a Reference is required (Motion 215)</p> <p>Change Number 92 – Replace Clause 3.2.1.6 with a clearer description of what it means to be functionally equivalent to the pseudo-code (Motion 216)</p> <p>Change Number 93 – clarify Clause 6.3.3 – Data-Maintenance must run every 58 to 63 seconds (Motion 217)</p>
14-Mar-2008	1.5.1	<p>Removed BEA and EnterpriseDB from membership list.</p> <p>Change Number 94 – change “account” to “acct_id” in the pseudo-code for Trade-Order Frame 3 (Motion 228)</p>
18-Mar-2008	1.5.1	Change Number 95 – re-order clause 10 (Motion 236)
15-Apr-2008	1.5.1	Change Number 97 – In clause 2.3.9 change the cross reference from 6.6.6.1 to 6.6.6.2

		(Motion 240).
19-May-2008	1.6.0	<p>Change Number 96 – Add status checking to EGenTxnHarness pseudo-code (Motion 237).</p> <p>Change Number 98 – Clarify clause 8.2.1 (Motion 241)</p> <p>Change Number 99 – Change clause 1.1.60-Day Period definition by replacing “indices” with “User-Defined Objects” (Motion 242)</p> <p>Change Number 100 – Change clause 2.3.9 comment by replacing “associated objects” with “associated User-Defined Objects” (Motion 243)</p> <p>Change Number 101 – Change clause 8.2.1 replace “indices” with “User-Defined Objects” (Motion 244)</p> <p>Change Number 102 – Change clause 9.3.2.1 replace “indices” with “User-Defined Objects” (Motion 245)</p> <p>Change Number 103 – Change clause 2.2.4.4 replace “indices” with “references” and “index” with “reference” (Motion 246)</p> <p>Change Number 104 – Add sentence to clause 4.4.1.6 (Motion 253)</p>
12-Jun-2008	1.6.0	<p>Added Fusion-IO, Greenplum, Kickfire and Vertica to TPC members table.</p> <p>Fixed some errors in Change Number 96 – Add status checking to EGenTxnHarness pseudo-code (Motion 237).</p> <p>Change Number 106 - In Clause 6.5.2.1 added parenthesis around sTn – eTn-1 (Motion 266).</p>
17-Jun-2008	1.6.0	Change Number 105 – change to Change Number 96 which added status checking, back out the “if (list_len == 0) then status = +111” from Broker-Volume (Motion 265).
31-Jul-2008	1.6.0	<p>Change Number 107 – Change C_F_NAME and AP_F_NAME from CHAR(30) to CHAR(20). Change C_L_NAME and AP_L_NAME from CHAR(30) to CHAR(25).</p> <p>Change CO_CEO from CHAR(100) to CHAR(46). Change T_EXEC_NAME from CHAR(64) to CHAR(46). Change B_NAME from CHAR(100) to CHAR(49).</p>
13-Aug-2008	1.6.0	<p>Editorial changes T_EXEC_NAME from CHAR(46) to CHAR(49) because Trade-Update Frame 1 can add a middle initial to it. Made the corresponding change to ex_name char(64) to char(49) in Trade-Update Frame 1 pseudo-code. Updated diagram A.b in section A.13 moved the yellow and purple striped line that goes from CMESUTInterface to cyan DoTxn to go to purple DoTxn instead.</p>
11-Sep-2008	1.6.0	<p>Change Number 108 – move “min_day_len” before “max_day_len” in table 3.2.1.2 (Motion 272).</p> <p>Change Number 109 – Combine the first two lines of clause 3.2.1.8 (Motion 273)</p> <p>Change Number 110 – Clarify the last two lines of clause 3.2.1.8 (Motion 274)</p> <p>Change Number 113 – In Market-Feed Frame 1 Parameters change the description of “status” to use the word “Frame” instead of the word “Transaction” (Motion 278)</p> <p>Change Number 116 – In Trade-Lookup Frame 4 pseudo-code change status = -641 to status = +641 (Motion 282)</p> <p>Change Number 117 – Add “,DM” to the first line of clause 10.6.2.1 (Motion 283)</p> <p>Change Number 118 – In clause 3.3.11 change 10c to 10C (Motion 284)</p> <p>Change Number 119 – Change “LOB” to “BLOB” and add the definition BLOB_REF (Motion 287)</p>
19-Nov-2008	1.7.0	<p>Change Number 111 – Add table to clause 3.2.1.8 listing EGen warnings and where they happen in the code (Motion 275)</p> <p>Change Number 112 – Change comment in Customer-Position Frame 2 pseudo-code in Clause 3.3.2.4 to read “Should return 10 to 30 rows” (Motion 277)</p> <p>Change Number 114 – Remove the max_send_len constant from clause 3.2.1.2 and the Market-Feed pseudo code (Motion 279)</p> <p>Change Number 115 – Change the Market-Feed pseudo-code in Clause 3.3.3 to reflect logic changes (Motion 280)</p> <p>Change Number 120 – Add “and outputs” to 1st and 3rd sentences of clause 9.4.2.1 (Motion 291)</p> <p>Change Number 121 – Update the table in clause 9.3.9.1 to move the entries listed in Clause 4 to Clause 5 to be consistent with clause 9.4.5.5. Retain the entry for Clause 4 adding a notation that no files are required (Motion 302)</p> <p>Change Number 122 – Modify the 3-second interval to a 30-second interval in Clause</p>

		6.4.2.2 (Motions 312 and 316)
11-Jun-2009	1.8.0	<p>Change Number 124 – Remove “status=+412 from Market-Watch pseudo-code in Clause 3.3.4.3</p> <p>Change Number 125 – Updated table in Clause 3.2.1.8 to include additional warnings</p> <p>Change Number 126 – Modified Clause 5.3.1 to reflect TPC policies change</p> <p>Change Number 127 – Modified Clause 8.2.1 Comment 1 to include “solid-state storage” to the list of on-line storage examples</p> <p>Change Number 129 – Modified Clause 7.5 to rework durability definitions and procedures</p> <p>Change Number 130 – Corrected typos in Clause 7.5.2, 7.5.3.2, and 7.5.4. Removed redundant wording in Clause 7.5.5 and 7.5.6.1. Modified Clause 6.7.2 wording to expand description of the graph requirements. Modified Clause 7.5.5.6. Modified Clause 7.5.6.7 for consistency of wording. Modified Clause 7.5.7 to clarify steps required for durability testing. Modified Clause 7.5.8.3 to add a line to the graph at 95% of the reported throughput. Modified Clause 7.6.7.2 for wording consistency.</p> <p>Change Number 131 – Modified Clause 3.2.1.8 and 3.3.7.5 to remove the +734 status check.</p>
17-Sep-2009	1.9.0	<p>Change Number 135 – Added bullet to Clause 8.1 to address heterogeneous storage devices</p> <p>Change Number 136 – Modified Clause 8.1 to clarify the usage of Free Space</p>
11-Feb-2010	1.10.0	<p>Change Number 137 – Added “Free Space and / or” to the second bullet of Clause 8.1.</p> <p>Change Number 138 – Changed “8 hours of execution” to “Business Day” in the second bullet of Clause 8.1.</p> <p>Change Number 139 – Changed both occurrences of “Digits” with “decimal places” in Clause 6.3.2.</p> <p>Change Number 140 – Corrected various typos and editorial issues.</p> <p>Change Number 141 – Corrected various typos and editorial issues.</p> <p>Change Number 143 – Inserted a new Clause 6.6.6.2 for initial database size.</p> <p>Change Number 144 – Moved the computation of 60-day space (Clause 8.2.2) to Clause 6.6.6.</p> <p>Change Number 145 – Removed the term “Network” from Clause 8.1.</p> <p>Change Number 146 – Added definition of Measured Configuration.</p> <p>Change Number 147 – Moved Clause 8.2.1 to a new Clause 6.6.7.</p> <p>Change Number 148 – Added wording to Clauses 0.1.1, 6.7.3, 9.1, and 10.1.3 to support TPC-Energy.</p> <p>Change Number 150 – Modified TPC-Energy wording in Clause 0.1.1.</p> <p>Change Number 151 – Removed comment 1 and 2 from 6.6.6.6.</p> <p>Change Number 152 – Removed the second sentence of Clause 6.6.6; Deleted Comment 1 from Clause 6.6.7; Renamed “Comment 2” to “Comment” in Clause 6.6.7; Removed the parenthetical statement in Clause 8.1; Used the defined term “On-Line” in Clauses 6.6.7 and 8.1; Added the definition of On-Line as Clause 8.2.1; Modified Clause 8.2.2.</p> <p>Change Number 153 – Removed bullets 2 and 3 from Clause 8.1; added new bullet 2 to Clause 8.1.</p>
22-Apr-2010	1.11.0	<p>Revised TPC membership list</p> <p>Change Number 123 – Moved status checks from Market-Feed from pseudo-code to the harness; updated the status check for Last_Trade updates, added a frame output for the number of rows updated.</p> <p>Change Number 128 – Moved status checks for +641, -711, -721, -811, and -911 from the pseudo-code to the harness and added frame/transaction output for the number of rows found.</p> <p>Change Number 132 – Changed the cust_assets variable name to acct_assets to more accurately reflect what is being computed in Clause 3.3.7.5.</p> <p>Change Number 142 – Reconciled harness pseudo-code with actual harness code implementation.</p> <p>Change Number 149 – Removed the status output parameter from each frame.</p> <p>Change Number 159 – Replaced TAX_RATE with TAXRATE in Clause 3.3.8.2; Removed</p>

		the empty bullet in Clause 8.1; Replaced "need be" with "may be" in Clause 8.2.4.
25-Jun-2010	1.12.0	Change Number 160 – Modified Clause 7.6 to rework Data Accessibility definitions and procedures (Motion 451)

Typographic Conventions

The following typographic conventions are used in this specification:

Convention	Description
Bold	Bold type is used to highlight terms that are defined in this document
<i>Italics</i>	Italics type is used to highlight a variable that indicates some quantity whose value can be assigned in one place and referenced in many other places.
UPPERCASE	Uppercase letters indicate database schema object names such as table and column names. In addition, most acronyms are in uppercase.

Diagram Color-Coding Conventions

Concept	
Customer	Light Green with down diagonal hashing
Broker	Pale Blue with up diagonal hashing
Market	Rose with horizontal hashing
Implementation	
TPC Provided Code	<i>Turquoise Italics</i>
Sponsor Provided Code	<u>Lavender Underline</u>
Commercially Available Product	Light Yellow

CLAUSE 0 -- PREAMBLE

0.1

Introduction

TPC Benchmark™ E (TPC-E) is an On-Line Transaction Processing (OLTP) workload. It is a mixture of read-only and update intensive transactions that simulate the activities found in complex OLTP application environments. The database schema, data population, transactions, and implementation rules have been designed to be broadly representative of modern OLTP systems. The benchmark exercises a breadth of system components associated with such environments, which are characterized by:

- The simultaneous execution of multiple transaction types that span a breadth of complexity;
- Moderate system and application execution time;
- A balanced mixture of disk input/output and processor usage;
- Transaction integrity (**ACID** properties);
- A mixture of uniform and non-uniform data access through primary and secondary keys;
- Databases consisting of many tables with a wide variety of sizes, attributes, and relationships with realistic content;
- Contention on data access and update.

The TPC-E operations are modeled as follows:

- The database is continuously available 24 hours a day, 7 days a week, for data processing from multiple **Sessions** and data modifications against all tables, except possibly during infrequent (e.g., once a month) maintenance **Sessions**.
- Due to the worldwide nature of the application modeled by the TPC-E benchmark, any of the transactions may be executed against the database at anytime, especially in relation to each other.

0.1.1

Goal of the TPC-E Benchmark

The TPC-E benchmark simulates the OLTP workload of a brokerage firm. The focus of the benchmark is the central database that executes transactions related to the firm's customer accounts. In keeping with the goal of measuring the performance characteristics of the database system, the benchmark does not attempt to measure the complex flow of data between multiple application systems that would exist in a real environment.

The mixture and variety of transactions being executed on the benchmark system is designed to capture the characteristic components of a complex system. Different transaction types are defined to simulate the interactions of the firm with its customers as well as its business partners. Different transaction types have varying run-time requirements.

The benchmark defines:

- Two types of transactions to simulate Consumer-to-Business as well as Business-to-Business activities
- Several transactions for each transaction type
- Different execution profiles for each transaction type
- A specific run-time mix for all defined transactions

For example, the database will simultaneously execute transactions generated by systems that interact with customers along with transactions that are generated by systems that interact with financial markets as well as administrative systems.

The benchmark system will interact with a set of **Driver** systems that simulate the various sources of transactions without requiring the benchmark to implement the complex environment.

The **Performance Metric** reported by TPC-E is a "business throughput" measure of the number of completed Trade-Result transactions processed per second (see Clause 6.7.1). Multiple **Transactions** are used to simulate the business activity of processing a trade, and each **Transaction** is subject to a **Response Time** constraint. The **Performance Metric** for the benchmark is expressed in transactions-per-second-E (**tpsE**). To be compliant with the TPC-E standard, all references to **tpsE Results** must include the **tpsE** rate, the associated **price-per-tpsE**, and the **Availability Date** of the **Priced Configuration** (See Clause 6.7.3 for more detail).

To be compliant with the optional TPC-Energy standard, the additional primary metric, expressed as watts-per-**tpsE**, must be reported. The requirements of the TPC-Energy Specification can be found at [www\(tpc.org](http://www(tpc.org)).

Although this specification defines the implementation in terms of a relational data model, the database may be implemented using any commercially available **Database Management System (DBMS)**, **Database Server**, file system, or other data repository that provides a functionally equivalent implementation. The terms "table", "row", and "column" are used in this document only as examples of logical data structures.

TPC-E uses terminology and metrics that are similar to other benchmarks, originated by the TPC and others. Such similarity in terminology does not imply that TPC-E **Results** are comparable to other benchmarks. The only benchmark **Results** comparable to TPC-E are other TPC-E **Results** that conform to a comparable version of the TPC-E specification.

0.1.2

Restrictions and Limitations

Despite the fact that this benchmark offers a rich environment that represents many OLTP applications, this benchmark does not reflect the entire range of OLTP requirements. In addition, the extent to which a customer can achieve the **Results reported** by a vendor is highly dependent on how closely TPC-E approximates the customer application. The relative performance of systems derived from this benchmark does not necessarily hold for other workloads or environments. Extrapolations to any other environment are not recommended.

Benchmark **Results** are highly dependent upon workload, specific application requirements, and systems design and implementation. Relative system performance will vary because of these and other factors. Therefore, TPC-E should not be used as a substitute for specific customer application benchmarking when critical capacity planning and/or product evaluation decisions are contemplated.

Benchmark **Sponsors** are permitted various possible implementation designs, insofar as they adhere to the model described and pictorially illustrated in this specification. A **Full Disclosure Report (FDR)** of the implementation details, as specified in Clause 9.1, must be made available along with the **reported Results**.

Comment: While separated from the main text for readability, comments are a part of the standard and must be enforced.

0.2

General Implementation Guidelines

The purpose of TPC benchmarks is to provide relevant, objective performance data to industry users. To achieve that purpose, TPC benchmark specifications require that benchmark tests be implemented with systems, products, technologies and pricing that:

- Are generally available to users.
- Are relevant to the market segment that the individual TPC benchmark models or represents (e.g., TPC-E models and represents high-volume, complex OLTP database environments).
- A significant number of users in the market segment the benchmark models or represents would plausibly implement.

The use of new systems, products, technologies (hardware or software) and pricing is encouraged so long as they meet the requirements above. Specifically prohibited are benchmark systems, products, technologies, pricing (hereafter referred to as "implementations") whose primary purpose is performance optimization of TPC benchmark **Results** without any corresponding applicability to real-world applications and environments. In other words all "benchmark specials" implementations that improve benchmark **Results** but not real-world performance or pricing, are prohibited.

The following characteristics should be used as a guide to judge whether a particular implementation is a benchmark special. It is not required that each point below be met, but that the cumulative weight of the evidence be considered to identify an unacceptable implementation. Absolute certainty or certainty beyond a reasonable doubt is not required to make a judgment on this complex issue. The question that must be answered is this: based on the available evidence, does the clear preponderance (the greater share or weight) of evidence indicate that this implementation is a benchmark special?

The following characteristics should be used to judge whether a particular implementation is a benchmark special:

- Is the implementation generally available, documented, and supported?
- Does the implementation have significant restrictions on its use or applicability that limits its use beyond TPC benchmarks?
- Is the implementation or part of the implementation poorly integrated into the larger product?

Does the implementation take special advantage of the limited nature of TPC benchmarks (e.g., transaction **Profile**, **Transaction Mix**, transaction concurrency and/or contention, transaction isolation) in a manner that would not be generally applicable to the environment the benchmark represents?

- Is the use of the implementation discouraged by the vendor? (This includes failing to promote the implementation in a manner similar to other products and technologies.)
- Does the implementation require uncommon sophistication on the part of the end-user, programmer, or system administrator?
- Is the pricing unusual or non-customary for the vendor, or unusual or non-customary to normal business practices? See the effective version of the TPC Pricing Specification for additional information.
- Is the implementation being used (including beta) or purchased by end-users in the market area the benchmark represents? How many? Multiple sites? If the implementation is not currently being used by end-users, is there any evidence to indicate that it will be used by a significant number of users?

0.3 General Measurement Guidelines

TPC benchmark **Results** are expected to be accurate representations of system performance. Therefore, there are certain guidelines, which are expected to be followed when measuring those **Results**. The approach or methodology is explicitly outlined in or described in the specification.

- The approach is an accepted engineering practice or standard.
- The approach does not enhance the **Results**.
- Equipment used in measuring **Results** is calibrated according to established quality standards.
- Fidelity and candor is maintained in reporting any anomalies in the **Results**, even if not specified in the benchmark requirements.

The use of new methodologies and approaches is encouraged so long as they meet the requirements above.

CLAUSE 1 -- BENCHMARK OVERVIEW

1.1 Definitions

NUMBERS _____

60-Day Period

Storage must be priced for sufficient space to store and maintain the data and **User-Defined Objects** generated during a period of 60 **Business Days** at the **Reported Throughput** called the **60-Day Period**.

60-Day Space

The **60-Day Space** must be computed as:

$$\text{60-Day Space} = \text{Initial Database Size} + (60 * \text{Data Growth})$$

A _____

ACID

ACID – the transactional properties of Atomicity, Consistency, Isolation and Durability.

Add

The word “**Add**” indicates that a number of rows are added to the TPC-E table specified by the **Database Footprint**. TPC-E Table row(s) can only be added in a **Frame** where the word “**Add**” is specified.

Application

The term **Application** or **Application Program** refers to code that is not part of the commercially available components of the **SUT**, but used specifically to implement the **Transactions** (see Clause 3.3) of this benchmark. For example, stored procedures, triggers, and referential integrity constraints are considered part of the **Application Program** when used to implement any portion of the **Transactions**, but are not considered part of the **Application Program** when solely used to enforce integrity rules (see Clause 2.4) or transparency requirements (see Clause 2.5) independently of any **Transaction**.

Application Recovery

Application Recovery: the process of recovering the business application after a **Single Point of Failure** and reaching a point where the business meets certain operational criteria.

Application Recovery Time

Application Recovery Time: The elapsed time between the start of **Application Recovery** and the end of **Application Recovery** (see Clause 7.5.6.5).

Arbitrary Transaction

An **Arbitrary Transaction** is a **Database Transaction** that executes arbitrary operations against the database at a minimum isolation level of L0 (see Clause 7.4.1.3).

Attestation Letter

Attestation Letter: The **Auditor's** opinion regarding the compliance of a **Result** must be consigned in an **Attestation Letter** delivered directly to the **Sponsor**.

Auditor

See **TPC-Certified Auditor**.

Availability Date

The date when all products necessary to achieve the stated performance will be available (stated as a single date on the **Executive Summary Statement**). This is known as the **Availability Date**.

B _____

BALANCE_T

BALANCE_T is defined as **SENUM(12,2)** and is used for holding aggregate account and transaction related values such as account balances, total commissions, etc.

BLOB(n)

BLOB(n) is a data type capable of holding a variable length binary object of n bytes.

BLOB_REF

BLOB_REF is a data type capable of referencing a **BLOB(n)** object that is stored outside the table on the SUT.

BOOLEAN

BOOLEAN is a data type capable of holding at least two distinct values that represent FALSE and TRUE.

Brokerage Initiated

Brokerage Initiated: These **Transactions** simulate broker interactions with the system and are initiated by the **Customer Emulator** component of the benchmark **Driver**.

Broker Tables

Broker Tables: This set includes 9 tables that contain information about the brokerage firm and broker related data.

Business Day

Business Day: a period of eight hours of transaction processing activity.

Business Recovery

Business Recovery: the process of recovering from a **Single Point of Failure** and reaching a point where the business meets certain operational criteria.

Business Recovery Time

Business Recovery Time: the elapsed period of time between start of **Business Recovery** and end of **Business Recovery** (see Clause 7.5.6.9).

C _____

Catastrophic

Catastrophic: a type of failure where processing is interrupted without any foreknowledge given to the **SUT**. Subsequent to this interruption, only in the failed database instance are all contexts for all active applications lost and all memory cleared.

CE

See **Customer Emulator**.

CHAR(n)

CHAR(n) means a character string that can hold up to n single-byte characters. Strings may be padded with spaces to the maximum length. **CHAR(n)** must be implemented using a **Native Data Type**.

Commit / Committed

Commit: a control operation that:

- Is initiated by a unit of work (a **Transaction**)
- Is implemented by the **DBMS**
- Signifies that the unit of work has completed successfully and all tentatively modified data are to persist (until modified by some other operation or unit of work)

Upon successful completion of this control operation both the **Transaction** and the data are said to be **Committed**.

Configured Customers

Configured Customers means the number of customers (with corresponding rows in the associated TPC-E tables) configured at database generation.

Customer Emulator

One key piece of a compliant TPC-E **Driver** is the **Customer Emulator** (CE). The CE is responsible for emulating customers, requesting a service of the brokerage house, providing the necessary input for the requested service, etc. Therefore, the CE is responsible for the following.

- Deciding which **Customer Initiated** or **Brokerage Initiated Transaction** to perform next (Broker-Volume, Customer-Position, Market-Watch, Security-Detail, Trade-Lookup, Trade-Order, Trade-Update and Trade-Status).
- Generating compliant data to be used as inputs for the selected **Transaction**.
- Sending the **Transaction** request and associated input data to the **SUT**.
- Receiving the **Transaction** response and associated output data from the **SUT**.
- Measuring the **Transaction's Response Time**.

Comment: The CE may optionally perform additional operations as well, such as statistical accounting, data logging, etc.

Customer Initiated

Customer Initiated: These **Transactions** simulate customer interactions with the system and are initiated by the **Customer Emulator** component of the benchmark **Driver**.

Customer Tables

Customer Tables: This set includes 9 tables that contain information about the customers of the brokerage firm.

D _____

Data Accessibility

Data Accessibility: The ability to maintain database operations with full data access after the permanent irrecoverable failure of any single **Durable Medium** containing database tables, recovery log data, or **Database Metadata**.

Data-Maintenance Generator

Another key piece of a compliant TPC-E **Driver** is the single instance of the **Data-Maintenance Generator** (DM). The DM is responsible for:

- Generating compliant data to be used as inputs for the Data-Maintenance **Transaction**
- Sending the **Transaction**'s request and associated input data to the **SUT**
- Receiving the **Transaction**'s response and associated output data from the **SUT** and measuring the **Transaction's Response Time**.

Comment: The DM may optionally perform additional operations as well, such as statistical accounting, data logging, etc. The DM may optionally be used to initiate a single Trade-Cleanup **Transaction** before the start of a **Test Run**.

Database Footprint

The **Database Footprint** of a **Transaction** is the set of required database interactions to be executed by that **Transaction**.

Database Interface

Database Interface – Commercially available product used by the **Frame Implementation** to communicate with the **Database Server**. It is possible that the **Database Interface** may communicate with the **Database Server** over a **Network**, but this is not a requirement.

Database Logic

Database Logic – **Sponsor** written **Frame implementation** logic (e.g. stored SQL procedure).

Database Management System

A **Database Management System (DBMS)** is a collection of programs that enable you to store, modify, and extract information from a database. There are many different types of **DBMSs**, ranging from small systems that run on personal computers to huge systems that run on mainframes. From a technical standpoint, **DBMSs** can differ widely. The terms relational, network, flat, and hierarchical all refer to the way a **DBMS** organizes information internally. The internal organization can affect how quickly and flexibly you can extract information. Requests for information from a database are made in the form of a query, which is a stylized question. The set of rules for constructing queries is known as a query language. The information from a database can be presented in a variety of formats. Most **DBMSs** include a report writer program that enables you to output data in the form of a report.

Database Metadata

Database Metadata: information managed by the **DBMS** and stored in the database to define, manage and use the database objects, e.g. tables, views, synonyms, value ranges, indexes, users, etc.

Database Recovery

Database Recovery: the process of recovering the database from a **Single Point of Failure** system failure.

Database Recovery Time

Database Recovery Time: the duration from the start of **Database Recovery** to the point when database files complete recovery.

Database Server

Database Server – Commercially available product(s). **Sponsor** provided logic may run in the context of the **Database Server** (e.g. a stored SQL procedure). An example of a **Database Server** is:

- commercially available **DBMS** running on a
- commercially available **Operating System** running on a
- commercially available hardware system utilizing
- commercially available storage

Database Session

To work with a database instance, to make queries or to manage the database instance, you have to open a **Database Session**. This can happen as follows: The user logs on to the database with a user name and password, thus opening a **Database Session**. Later, the **Database Session** is terminated explicitly by the user or closed implicitly when the timeout value is exceeded. A database tool implicitly opens a **Database Session** and then closes it again.

Database Transaction

A **Database Transaction** is an **ACID** unit of work.

Data Growth

Data Growth: the space needed in the **DBMS** data files to accommodate the increase in the **Growing Tables** resulting from executing the **Transaction Mix** at the **Reported Throughput** during the period of required **Sustainable** performance.

$$\text{Data Growth} = \text{Data-Space-per-Trade-Result} * \text{tpsE} * \text{Business Day duration in seconds}$$

DATE

DATE represents the data type of date with a granularity of a day and must be able to support the range of January 1, 1800 to December 31, 2199, inclusive. **DATE** must be implemented using a **Native Data Type**.

Comment: A time component is not required but may be implemented.

DATETIME

DATETIME represents the data type for a date value that includes a time component. The date component must meet all requirements of the **DATE** data type. The time component must be capable of representing the range of time values from 00:00:00 to 23:59:59. Fractional seconds may be implemented, but are not required. **DATETIME** must be implemented using a **Native Data Type**.

DBMS

See **Database Management System**

Digit

Digit means decimal digit.

Dimension Tables

Dimension Tables: This set includes 4 dimension tables that contain common information such as addresses and zip codes.

Dispatch Time

Each **EGenDriverCE** thread of execution calling the **EGenDriver Connector** interface creates a sequence of **Transactions**, defined chronologically as { T1, T2, ... Tn }. Within each sequence, the **Dispatch Time of Transaction n** is defined as follows:

- for the Non-Blocking Driver Thread architecture (see 6.2.3.2)
 - For n=1: $DT_n = 0$
 - For n>1: $DT_n = (sT_n - sT_{n-1})$
- for all other architectures in Clause 6.2
 - For n=1: $DT_n = 0$
 - For n>1: $DT_n = sT_n - eT_{n-1}$
- Where sT_n and eT_n are defined in Clause 6.5.1.1

DM

See **Data-Maintenance Generator**.

Driver

To measure the performance of the OLTP system, a simple **Driver** generates **Transactions** and their inputs, submits them to the **System Under Test**, and measures the rate of completed **Transactions** being returned. To simplify the benchmark and focus on the core transactional performance, all application functions related to user interface and display functions have been excluded from the benchmark. The **System Under Test** is focused on portraying the components found on the server side of a transaction monitor or application server.

Durability

See **Durable**.

Durability Throughput Requirements

Durability Throughput Requirements: conditions the **SUT** must satisfy for all **Durability** tests (see Clause 7.6.2).

Durable / Durability

Durable / Durability: In general, state that persists across failures is said to be **Durable** and an implementation that ensures state persists across failures is said to provide **Durability**. In the context of the benchmark, **Durability** is more tightly defined as the **SUT**'s ability to ensure all **Committed** data persist across any **Single Point of Failure**.

Durable Medium

Durable Medium: a data storage medium that is inherently non-volatile such as a magnetic disk or tape. **Durable Media** is the plural of **Durable Medium**.

E _____

EGen

EGen is a TPC provided software environment that must be used in a **Test Sponsor's** implementation of the TPC-E benchmark. The software environment is logically divided into three packages: **EGenProjectFiles**, **EGenInputFiles**, and **EGenSourceFiles**. The software packages provide functionality to use: **EGenLoader** to generate the data used to populate the database, **EGenDriver** to generate transactional data and **EGenTxnHarness** to control frame invocation.

EGenDriver

EGenDriver comprises the following parts:

- **EGenDriverCE** provides the core functionality necessary to implement a **Customer Emulator**.
- **EGenDriverMEE** provides the core functionality necessary to implement a **Market Exchange Emulator**.
- **EGenDriverDM** provides the core functionality necessary to implement the **Data-Maintenance Generator**.

EGenDriver provides core transactional functionality (e.g. **Transaction Mix** and input generation) necessary to implement a **Driver**.

EGenDriverCE

EGenDriverCE – any and/or all instantiations of the CCE class (see **EGenSourceFiles** CE.h and CE.cpp).

EGenDriverDM

EGenDriverDM – the single instantiation of the CDM class (see **EGenSourceFiles** DM.h and DM.cpp).

EGenDriverMEE

EGenDriverMEE – any and/or all instantiations of the CMEE class (see **EGenSourceFiles** MEE.h and MEE.cpp).

EGenInputFiles

EGenInputFiles is a set of TPC provided text files containing rows of tab-separated data, which are used by various **EGen** packages as “raw” material for data generation.

EGenLoader

EGenLoader is a binary executable, generated by using the methods described in **EGenProjectFiles** with source code from **EGenSourceFiles**, including any extensions by a **Test Sponsor** (see Clause 5.7.4). When executed, **EGenLoader** uses **EGenInputFiles** to produce a set of data that represents the initial state of the TPC-E database.

EGenLogger

EGenLogger logs the initial configuration and any re-configuration of **EGenDriver** and **EGenLoader**, and compares current configuration with the TPC-E prescribed defaults.

EGenProjectFiles

EGenProjectFiles is a set of TPC provided files used to facilitate building the **EGen** packages in a **Test Sponsor's** environments.

EGenSourceFiles

EGenSourceFiles is the collection of TPC provided C++ source and header files.

EGenTables

EGenSourceFiles contain class definitions that provide abstractions of the TPC-E tables. These table classes are known collectively as **EGenTables** and they encapsulate the functionality needed to generate the data for each of the TPC-E tables.

EGenValidate

EGenValidate is a binary executable, generated by using methods described in **EGenProjectFiles** with source code from **EGenSourceFiles**. When executed, **EGenValidate** uses **Sponsor** provided input to validate that the **Sponsor's Measurement Interval** had compliant Trade-Results per **Load Unit**.

EGenTxnHarness

EGenTxnHarness defines a set of interfaces that are used to control the execution of, and communication of inputs and outputs, of **Transactions** and **Frames**.

ENUM

ENUM(m[,n]) or **SENUM(m[,n])** means an exact numeric value (unsigned or signed, respectively). **ENUM** and **SENUM** are identical to **NUM** and **SNUM**, respectively, except that they must be implemented using a **Native Data Type** which provides exact representation of at least n **Digits** of precision after the decimal place.

Executive Summary Statement

The term **Executive Summary Statement** refers to the Adobe Acrobat PDF file in the **ExecutiveSummaryStatement** folder in the **FDR**. The contents of the **Executive Summary Statement** are defined in Clause 9.

F _____

FDR

The **FDR** is a zip file of a directory structure containing the following:

- A **Report** in Adobe Acrobat PDF format,
- An **Executive Summary Statement** in Adobe Acrobat PDF format,

- An XML document (“ES.xml”) with approximately the same information as in the **Executive Summary Statement**,
- The **Supporting Files** consisting of various source files, scripts, and listing files. Requirements for the **FDR** file directory structure are described below.

Comment: The purpose of the **FDR** is to document how a benchmark **Result** was implemented and executed in sufficient detail so that the **Result** can be reproduced given the appropriate hardware and software products.

FIN_AGG_T

FIN_AGG_T is defined as **SENUM(15,2)** and is used for holding aggregated financial data such as revenue figures, valuations, and asset values.

Fixed Space

Fixed Space: any other space used to store static information and indices. It includes all database storage space allocated to the test database which does not qualify as either **Free Space** or **Growing Space**.

Fixed Tables

Fixed Tables: These tables always have the same number of rows regardless of the database size and transaction throughput. For example, TRADE_TYPE has five rows.

Foreign Key

A **Foreign Key** (FK) is a column or combination of columns used to establish and enforce a link between the data in two tables. A link is created between two tables by adding the column or columns that hold one table's **Primary Key** values to the other table. This column becomes a **Foreign Key** in the second table.

Frame

A **Frame** is the **Sponsor** implemented **Transaction** logic, which is invoked as a unit of execution by the **EGenTxnHarness**. The database interactions of a **Transaction** are all initiated from within its **Frames**.

Frame Implementation

Frame Implementation – Sponsor provided functionality that accepts inputs from, and provides outputs to, **EGenTxnHarness** through a **TPC Defined Interface**. The **Frame Implementation** and all down-stream functional components are responsible for providing the appropriate functionality outlined in the **Transaction Profiles** (Clause 3.3).

Free Space

Free Space: any space allocated to the test database and available for future use. It includes all database storage space not already used to store a database entity (e.g., a row, an index, **Database Metadata**) or not already used as formatting overhead by the **DBMS**.

Full Disclosure Report (FDR)

See **FDR**.

G _____

Growing Space

Growing Space: any space used to store existing rows from the **Growing Tables** and their associated **User-Defined Objects**. It includes all database storage space that is added to the test database as a result of inserting a new row in the **Growing Tables**, such as row data, index data and other overheads such as index overhead, page overhead, block overhead, and table overhead.

Growing Tables

Growing Tables: These tables each have an initial cardinality that has a defined relationship to the cardinality of the CUSTOMER table. However, the cardinality increases with new growth during the benchmark run at a rate that is proportional to transaction throughput rates.

H _____

I _____

IDENT_T

IDENT_T is defined as **NUM(11)** and is used to hold non-trade identifiers.

Initial Database Size

Initial Database Size is measured after the database is initially loaded with the data generated by **EGenLoader**. **Initial Database Size** is any space allocated to the test database which is used to store a database entity (e.g. a row, an index, **Database Metadata**), or used as formatting overhead by the data manager.

Initial Trade Days

The **Initial Trade Days (ITD)** is the number of **Business Days** used to populate the database. This population is made of trade data that would be generated by the **SUT** when running at the **Nominal Throughput** for the specified number of **Business Days**. The number of **Initial Trade Days** is 300.

ITD

See **Initial Trade Days**.

J _____

K _____

L _____

Load Unit

The size of the CUSTOMER table can be increased in increments of 1000 customers. A set of 1000 customers is known as a **Load Unit**.

Log Growth

Log Growth: the space needed in the DBMS log files to accommodate the **Undo/Redo Log** resulting from executing the **Transaction Mix** at the **Reported Throughput** during the period of required **Sustainable** performance.

$$\text{Log Growth} = \text{Log-Space-per-Trade-Result} * \text{tpxE} * \text{Business Day duration in seconds}$$

M _____

Market Exchange Emulator

Another key piece of a compliant TPC-E **Driver** is the **Market Exchange Emulator (MEE)**. The **MEE** is responsible for emulating the stock exchanges: providing services to the brokerage house, performing requested trades, providing market activity updates, etc. Therefore, the **MEE** is responsible for the following:

- Receiving trade requests and their associated data from the **SUT**.
- Initiating Trade-Result **Transactions**, sending the associated data to the **SUT** and measuring the **Transaction's Response Time**.
- Initiating Market-Feed **Transactions**, sending the associated data to the **SUT** and measuring the **Transaction's Response Time**.

Comment: The **MEE** may optionally perform additional operations as well; such as statistical accounting, data logging, etc.

Market Tables

Market Tables: This set includes 11 tables that contain information about companies, markets, exchanges, and industry sectors.

Market Triggered

Market Triggered: These **Transactions** simulate the behavior of the market and are triggered by the **Market Exchange Emulator** component of the benchmark **Driver**.

May

The word “**may**” in the specification means that an item is truly optional.

Measured Configuration

See **System Under Test**.

Measured Throughput

The **Measured Throughput** is computed as the total number of **Valid Trade-Result Transactions** within the **Measurement Interval** divided by the duration of the **Measurement Interval** in seconds.

Measurement Interval

Measurement Interval: the period of time during **Steady State** chosen by the **Test Sponsor** to compute the **Reported Throughput**.

MEE

See **Market Exchange Emulator**

Modify

The word “**Modify**” indicates that the content of a TPC-E table column is modified within the **Frame**. The content of the table column can only be changed in a **Frame** where the word “**Modify**” is specified. When the original content of the table column must also be referenced or returned before it is modified, a “**Reference**” or a “**Return**” access method is also specified.

Must

The word “**must**” or the terms “required”, “requires”, “requirement” or “shall” in the specification, means that compliance is mandatory.

Must not

The phrase “**must not**” or the term “shall not” in the specification, means that this is an absolute prohibition of the specification.

N _____

Native Data Type

A **Native Data Type** is a built-in data type of the **DBMS** whose documented purpose is to store data of a particular type described in the specification. For example, **DATETIME** must be implemented with a built-in data type of the **DBMS** designed to store date-time information.

Network

Network – Sponsor provided functionality that must support communication through an industry standard communications protocol using a physical means. One outstanding feature of the Connector – **Network** – Connector communication is that it follows the relevant standards and must imply more than just an application package. It must be possible to have concurrent use of the means by other applications. Physical transport of the data is required and the underlying means of this transport must be capable of operating over arbitrary globally geographic distances. TPC/IP over a local area network is an example of an acceptable **Network** implementation.

Nominal Throughput

The **Nominal Throughput** of the TPC-E benchmark is defined to be 2.00 **Transactions-Per-Second-E** (tpsE) for every 1000 customer rows in the **Configured Customers**.

Non-catastrophic

The term **Non-catastrophic** as applied to a single failure is one where processing is not interrupted, but throughput may be degraded and the **SUT** may no longer be in a durable state until the **SUT** has recovered from the failure.

NUM(m[n])

NUM(m[n]) means an unsigned numeric value with at least m total **Digits**, of which n **Digits** are to the right (after) the decimal point. The data type must be able to hold all possible values which can be expressed as **NUM(m,n)**. Omitting n, as in **NUM(m)**, indicates the same as **NUM(m,0)**. **NUM** must be implemented using a **Native Data Type**.

O _____

On-Line

A storage device is considered **On-Line** if it is capable of providing an access time to data, for random read or update, of one second or less by the **Operating System**.

Comment: Examples of **On-Line** storage may include magnetic disks, optical disks, solid-state storage, or any combination of these, provided that the above mentioned access criteria is met.

Operating System/OS

The term **Operating System** refers to the program that, after being initially loaded into the computer by a boot program, manages all the other programs in a computer. The **Operating System** provides a software platform on top of which all other programs run. Without the **Operating System** and the core services that it provides no other programs can run and the computer would be non-functional. Other programs make use of the **Operating System** by making requests for services through a defined application program interface (API). All major computer platforms require an **Operating System**. The functions and services supplied by an **Operating System** include but are not limited to the following:

- Manages a dedicated set of processor and memory resources.
- Maintains and manages a file system.
- Loads applications into memory.
- Ensures that the resources allocated to one application are not used by another application in an unauthorized manner.

- Determines which applications should run in what order, and how much time should be allowed to run the application before giving another application a turn to use the systems resources.
- Manages the sharing of internal memory among multiple applications.
- Handles input and output to and from attached hardware devices such as hard disks, network interface cards etc.

Some examples of **Operating Systems** are listed below:

- Windows
- Unixes (Solaris, AIX)
- Linux
- MS-DOS
- Mac OS
- VMS
- Netware

P _____

Pacing Delay

Pacing Delay is defined as the total time injected into the **Dispatch Time (DT_n)** that is intended to decrease the rate at which **Transactions** are submitted to the **SUT**.

Part Number

See the definition of **Part Number** in the TPC Pricing Specification.

Performance Metric

The TPC-E **Reported Throughput** as expressed in tpsE. This is known as the **Performance Metric**.

Priced Configuration

Priced Configuration: The components to be priced defined in the benchmark specification, including all hardware, software and maintenance.

Price/Performance Metric

The TPC-E total 3-year pricing divided by the **Reported Throughput** is price/tpsE. This is also known as the **Price/Performance Metric**.

Primary Key

A **Primary Key** is a single column or combination of columns that uniquely identifies a row. None of the columns that are part of the **Primary Key** may be nullable. A table must have no more than one **Primary Key**.

Profile

Profile: the characteristics of a **Transaction**, as defined by the **Pseudo-code** and summarized by the **Database Footprint**.

Pseudo-code

Pseudo-code is a description of an algorithm that uses the structural conventions of programming languages, but omits language-specific syntax.

Q _____

R _____

Ramp-down

Ramp-down: the period of time from the end of **Steady State** to the end of the **Test Run**.

Ramp-up

Ramp-up: the period of time from the start of the **Test Run** to the start of **Steady State**.

Redundancy Level One

Redundancy Level One (Durable Media Redundancy): Guarantees access to the data on **Durable Media** when a single **Durable Media** failure occurs.

Redundancy Level Three

Redundancy Level Three (Full Redundancy): Includes **Redundancy Level Two** and guarantees access to the data on **Durable Media** when a single failure occurs within the **Durable Media** system, including communications between **Tier B** and the **Durable Media** system.

Redundancy Level Two

Redundancy Level Two (Durable Media Controller Redundancy): Includes **Redundancy Level One** and guarantees access to the data on **Durable Media** when a single failure occurs in the storage controller used to satisfy the redundancy level or in the communication media between the storage controller and the **Durable Media**.

Reference

The word “**Reference**” indicates that the TPC-E table column is identified in the database and the content is accessed within the **Frame** without passing the content of the table column to the **EGenTxnHarness**.

Referential Integrity

Referential Integrity preserves the relationship of data between tables, by restricting actions performed on **Primary Keys** and **Foreign Keys** in a table.

Remove

The word “**Remove**” indicates that a number of rows are removed from the TPC-E table specified by the **Database Footprint**. Table row(s) can only be removed in a **Frame** where the word “**Remove**” is specified. The number of rows that are removed is specified in the second column of the **Database Footprint** with either “# **row**” for a fixed number of rows or “**row(s)**” for an unspecified number of rows.

Report

The term **Report** refers to the Adobe Acrobat PDF file in the Report folder in the **FDR**. The contents of the **Report** are defined in Clause 9.

Reported

The term **Reported** refers to an item that is part of the **FDR**.

Reported Throughput

The **Performance Metric** reported by TPC-E is the **Reported Throughput**. The name of the metric used for the **Reported Throughput** of the **SUT** is **tpsE**. The value of this metric is based on the **Measured Throughput** and is bound by the limits defined in Clause 6.7.1.2.

Response Time

The **Response Time (RT)** is defined by:

$$RT_n = eT_n - sT_n$$

where:

sT_n and eT_n are measured at the **Driver**;

sT_n = time measured before the first byte of input data of the **Transaction** is sent by the **Driver** to the **SUT**; and

eT_n = time measured after the last byte of output data from the **Transaction** is received by the **Driver** from the **SUT**.

Comment: The resolution of the time stamps used for measuring **Response Time** must be at least 0.01 seconds.

Results

TPC-E **Results** are the **Performance Metric**, **Price/Performance Metric**.

Return

The word “**Return**” indicates that the TPC-E table column is referenced and that its content is retrieved from the database and passed to the **EGenTxnHarness**. The table column must be referenced in the same **Frame** where the word “**Return**” is specified. The content of the table column can only be passed to subsequent **Frames** via the input and output parameters specified in the **Frame** parameters.

Rollback

The word “**Rollback**” indicates that the specified **Frame** contains a control operation that rolls back the **Database Transaction**. The explicit rolling back of a **Database Transaction** can only occur in a **Frame** where the word “**Rollback**” is specified.

RT

See **Response Time**.

S _____

S_COUNT_T

S_COUNT_T is defined as **NUM(12)** and is used for holding the aggregate count of shares used in many tables.

S_PRICE_T

S_PRICE_T is defined as **ENUM(8,2)** and is used for holding the value of a share price.

S_QTY_T

S_QTY_T is defined as **SENUM(6)** and is used for holding the quantity of shares per individual trade.

Scale Factor

The **Scale Factor** is the number of required customer rows per single **Transactions-Per-Second-E** (tpsE). The **Scale Factor** for **Nominal Throughput** is 500.

Scaling Tables

Scaling Tables: These tables each have a defined cardinality that has a constant relationship to the cardinality of the CUSTOMER table. **Transactions** may update rows from these tables, but the table sizes remain constant.

SENUM

ENUM(m[n]) or **SENUM(m[n])** means an exact numeric value (unsigned or signed, respectively). **ENUM** and **SENUM** are identical to **NUM** and **SENUM**, respectively, except that they must be implemented using a **Native Data Type** which provides exact representation of at least n **Digits** of precision after the decimal place.

Session

See **Database Session**.

SF

See **Scale Factor**.

Should

The word “**should**” or the adjective “recommended”, mean that there might exist valid reasons in particular circumstances to ignore a particular item, but the full implication must be understood and weighed before choosing a different course.

Should not

The phrase “should not”, or the phrase “not recommended”, means that there might exist valid reasons in particular circumstances when the particular behavior is acceptable or even useful, but the full implications should be understood and the case carefully weighed before implementing any behavior described with this label.

SNUM

SNUM(m[,n]) is identical to **NUM(m[,n])** except that it can represent both positive and negative values. **SNUM** must be implemented using a **Native Data Type**.

Comment: A **SNUM** data type may be used (at the **Sponsor’s** discretion) anywhere a **NUM** data type is specified.

Sponsor

See **Test Sponsor**.

Start

The word “**Start**” indicates that the specified **Frame** contains a control operation that starts a **Database Transaction**. The start of a **Database Transaction** can only occur in a **Frame** where the word “**Start**” is specified.

Steady State

Steady State: the period of time from the end of the **Ramp-up** to the start of the **Ramp-down**.

Substitution

Substitution is defined as a deliberate act to replace components of the **Priced Configuration** by the **Test Sponsor** as a result of failing the availability requirements of the TPC Pricing Specification or when the **Part Number** for a component changes.

Supporting Files

Supporting Files refers to the contents of the **SupportingFiles** folder in the **FDR**. The contents of this folder, consisting of various source files, scripts, and listing files, are defined in Clause 9.

Sustainable

Sustainable: the performance over a given period of time (computed as the average throughput over that time) shows no significant variations.

SUT

See **System Under Test**.

System Under Test

System Under Test (SUT) – is defined to be the sum of **Tier A** and **Tier B**.

T _____

Test Sponsor

The **Test Sponsor** is the company officially submitting the **Result** with the **FDR** and will be charged the filing fee. Although multiple companies may sponsor a **Result** together, for the purposes of the TPC's processes the **Test Sponsor** must be a single company. A **Test Sponsor** need not be a TPC member. The **Test Sponsor** is responsible for maintaining the **FDR** with any necessary updates or corrections. The **Test Sponsor** is also the name used to identify the **Result**.

Test Run

Test Run: the entire period of time during which **Drivers** submit and the **SUT** completes **Transactions** other than Trade-Cleanup.

Test Run Graph

A graph of the one-minute average tpsE versus elapsed wall clock time measured in minutes must be reported for the entire **Test Run**. The x-axis represents the elapsed time from the **Test Run** start. The y-axis represents the one-minute average throughput in tpsE (computed as the total number of Trade-Result Transactions that complete within each one-minute interval divided by 60). A plot interval size of 1 minute must be used. The Ramp-up, Steady State, Measurement Interval, and Ramp-down must be identified on the graph. The **Test Run Graph** must be reported in the **Report**.

Tier A

Tier A – is defined to be all hardware and software needed to implement the down-stream Connector, EGenTxnHarness, Frame Implementation and Database Interface functional components.

Tier B

Tier B – is defined to be all hardware and software needed to implement the **Database Server** functional component. This includes data storage media sufficient to satisfy the initial database population requirements of clause 2.6.1 and the **Business Day** growth requirements of clause 6.6.6.4 and clause 6.6.6.5.

TPC-Certified Auditor

The term **TPC-Certified Auditor** is used to indicate that the TPC has reviewed the qualification of the **Auditor** and has certified his/her ability to verify that benchmark **Results** are in compliance with this specification. (Additional details regarding the **Auditor** certification process and the audit process can be found in Section 9 of the TPC Policy document.)

TPC Defined Interface

A **TPC Defined Interface** is a C++ class member which is designed to exchange data (and transfer execution control) between the **Sponsor**-provided **Driver/SUT** code and the TPC-provided **Driver/SUT** code.

TRADE_T

TRADE_T is defined as NUM(15) and is used to hold trade identifiers.

Transaction(s)

The TPC-E **Transactions** are at the heart of the workload. The core of each **Transaction** runs on the **Database Server**, but the logic of the **Transaction** interacts with several components of the benchmark environment.

A **Transaction** is composed of Harness-code and of the invocation of one or more **Frames**. The Trade-Cleanup **Transaction** is an exception. **Sponsors** may but do not have to run the Trade-Cleanup **Transaction** from EGenTxnHarness.

Transaction Mix

The Transaction Mix is composed of all Customer Initiated, Brokerage Initiated and Market Triggered Transactions.

Tunable Parameters

Tunable Parameters are parameters, switches or flags that can be changed to modify the behavior of the product. **Tunable Parameters** apply to both hardware and software and are not limited to those parameters intended for use by customers.

U _____

U*x

U*x is used in this specification to refer to various UNIX and Linux flavors (e.g. UNIX, Linux, AIX, Solaris).

Undo/Redo Log

Undo/Redo Log: records all changes made in data files. The **Undo/Redo Log** makes it possible to replay all the actions executed by the **Database Management System**. If something happens to one of the data files, a backed up data file can be restored and the **Undo/Redo Log** that was written since the backup can be played and applied which brings the data file to the state it had before it became unavailable.

User-Defined Object

Any object defined in the database is considered a **User-Defined Object**, except for the following:

- a TPC-E Table (see clause 2.2.3)
- a required **Primary Key** (see clause 2.2.3.1)
- a required **Foreign Key** (see clause 2.2.3.2)
- a required constraint (see clause 2.2.3.3)
- **Database Metadata**

V _____

Valid Transaction

The term **Valid Transaction** refers to any **Transaction** for which input data has been sent in full by the **Driver**, whose processing has been successfully completed on the **SUT** and whose correct output data has been received in full by the **Driver**.

VALUE_T

VALUE_T is defined as **SENUM(10,2)** and is used for holding non-aggregated transaction and security related values such as cost, dividend, etc.

Vulnerable Storage Component

Vulnerable Storage Component - any Field Replaceable Unit (FRU) within the **SUT** that:

- Has volatile storage (i.e. is not **Durable Media**)
- Participates in implementing the **Commit** control operation

Example: Assume an implementation like the one in Clause 4.3.1:

- The database server CPU registers and cache, database server main memory and database I/O controllers with caches (all found in **Tier B**) are considered to participate in implementing **Commit** operations
- The client front end CPU registers and caches, main memory and I/O controllers with caches are not considered to participate in implementing **Commit** operations.

W _____

X _____

Y _____

Z _____

1.2

Business and Application Environment

TPC Benchmark™ E is composed of a set of transactional operations designed to exercise system functionalities in a manner representative of complex OLTP application environments. These transactional operations have been given a life-like context, portraying the activity of a brokerage firm, to help users relate intuitively to the components of the benchmark. The TPC-E workload is centered on the activity of processing brokerage trades and uses a schema, which is logically divided into four sets of tables.

TPC-E models the activity of brokerage firm that must manage customer accounts, execute customer trade orders, and be responsible for the interactions of customers with financial markets. TPC-E does not attempt to be a model of how to build an actual application. The following diagram illustrates the transaction flow of the business model portrayed in the benchmark:

Figure 1.a - Business Model Transaction Flow

The purpose of a benchmark is to reduce the diversity of operations found in a production application, while retaining the application's essential performance characteristics so that the workload can be representative of a production system. A large number of functions have to be performed to manage a production brokerage system. Many of these functions are not of primary interest for performance analysis, since they are proportionally small in terms of system resource utilization or in terms of frequency of execution. Although these functions are vital for a production system, they merely create excessive diversity in the context of a standard benchmark and have been omitted in TPC-E.

The Company portrayed by the benchmark is a brokerage firm with customers who generate transactions related to trades, account inquiries, and market research. The brokerage firm in turn interacts with financial markets to execute orders on behalf of the customers and updates relevant account information.

The number of customers defined for the brokerage firm can be varied to represent the workloads of different size businesses.

The TPC-E benchmark is composed of a set of transactions that are executed against three sets of database tables that represent market data, customer data, and broker data. A fourth set of tables contains generic dimension data such as zip codes. The following diagram illustrates the key components of the environment:

Figure 1.b - Application Components

The benchmark has been reduced to simplified form of the application environment. To measure the performance of the OLTP system, a simple **Driver** generates **Transactions** and their inputs, submits them to the **System Under Test**, and measures the rate of completed **Transactions** being returned. To simplify the benchmark and focus on the core transactional performance, all application functions related to user interface and display functions have been excluded from the benchmark. The **System Under Test** is focused on portraying the components found on the server side of a transaction monitor or application server.

1.3 Transaction Summary

1.3.1 Broker-Volume

The Broker-Volume **Transaction** is designed to emulate a brokerage house's "up-to-the-minute" internal business processing. An example of a Broker-Volume **Transaction** would be a manager generating a report on the current performance potential of various brokers.

1.3.2 Customer-Position

The Customer-Position **Transaction** is designed to emulate the process of retrieving the customer's profile and summarizing their overall standing based on current market values for all assets. This is representative of the work performed when a customer asks the question "What am I worth today?"

1.3.3 Market-Feed

The Market-Feed **Transaction** is designed to emulate the process of tracking the current market activity. This is representative of the brokerage house processing the "ticker-tape" from the market exchange.

1.3.4 **Market-Watch**

The Market-Watch **Transaction** is designed to emulate the process of monitoring the overall performance of the market by allowing a customer to track the current daily trend (up or down) of a collection of securities. The collection of securities being monitored may be based upon a customer's current holdings, a customer's watch list of prospective securities, or a particular industry.

1.3.5 **Security-Detail**

The Security-Detail **Transaction** is designed to emulate the process of accessing detailed information on a particular security. This is representative of a customer doing research on a security prior to making a decision about whether or not to execute a trade.

1.3.6 **Trade-Lookup**

The Trade-Lookup **Transaction** is designed to emulate information retrieval by either a customer or a broker to satisfy their questions regarding a set of trades. The various sets of trades are chosen such that the work is representative of:

- performing general market analysis
- reviewing trades for a period of time prior to the most recent account statement
- analyzing past performance of a particular security
- analyzing the history of a particular customer holding

1.3.7 **Trade-Order**

The Trade Order **Transaction** is designed to emulate the process of buying or selling a security by a Customer, Broker, or authorized third-party. If the person executing the trade order is not the account owner, the **Transaction** will verify that the person has the appropriate authorization to perform the trade order. The **Transaction** allows the person trading to execute buys at the current market price, sells at the current market price, or limit buys and sells at a requested price. The **Transaction** also provides an estimate of the financial impact of the proposed trade by providing profit/loss data, tax implications, and anticipated commission fees. This allows the trader to evaluate the desirability of the proposed security trade before either submitting or canceling the trade.

1.3.8 **Trade-Result**

The Trade-Result **Transaction** is designed to emulate the process of completing a stock market trade. This is representative of a brokerage house receiving from the market exchange the final confirmation and price for the trade. The customer's holdings are updated to reflect that the trade has completed. Estimates generated when the trade was ordered for the broker commission and other similar quantities are replaced with the actual numbers and historical information about the trade is recorded for later reference.

1.3.9 **Trade-Status**

The Trade-Status **Transaction** is designed to emulate the process of providing an update on the status of a particular set of trades. It is representative of a customer reviewing a summary of the recent trading activity for one of their accounts.

1.3.10 **Trade-Update**

The Trade-Update **Transaction** is designed to emulate the process of making minor corrections or updates to a set of trades. This is analogous to a customer or broker reviewing a set of trades, and discovering that some minor editorial corrections are required. The various sets of trades are chosen such that the work is representative of:

- reviewing general market trends

- reviewing trades for a period of time prior to the most recent account statement
- reviewing past performance of a particular security

1.3.11 Data-Maintenance

The Data-Maintenance **Transaction** is designed to emulate the periodic modifications to data that is mainly static and used for reference. This is analogous to updating data that seldom changes.

1.3.12 Trade-Cleanup

The Trade-Cleanup **Transaction** is used to cancel any pending or submitted trades from the database.

1.4 Model Description

1.4.1 Entity Relationships

- 1.4.1.1 Trading in TPC-E is done by Accounts. Accounts belong to Customers. Customers are serviced by Brokers. Accounts trade Securities that are issued by Companies.
- 1.4.1.2 The total set of Securities that can be traded and the total set of Companies that issue Securities scales along with the number of Customers. For each unit of 1,000 Customers, there are 685 Securities and 500 Companies (with Companies issuing 1 to 5 Securities, mostly common shares, but some preferred as well).
- 1.4.1.3 All Companies belong to one of the 102 Industries. Each Industry belongs to one of the 12 market Sectors.
- 1.4.1.4 Each Account picks its average of ten Securities to trade from across the entire range of Securities.
- 1.4.1.5 Securities to be traded can be identified by the security symbol or by the company name and security issue.

1.4.2 Differences between Customer Tiers

- 1.4.2.1 The basic scaling unit of a TPC-E database is a set of 1,000 Customers. 20% of each 1,000 Customers belong to Tier 1, 60% to Tier 2, and 20% to Tier 3. Tier 2 Customers trade twice as often as Tier 1 Customers. Tier 3 Customers trade three times as often as Tier 1 Customers. In general, customer trading is non-uniform by tier within each set of 1,000 Customers.
- 1.4.2.2 Tier 1 Customers have 1 to 4 Accounts (average 2.5). Tier 2 Customers have 2 to 8 Accounts (average 5.0). Tier 3 Customers have 5 to 10 Accounts (average 7.5). Overall, there is an average of five Accounts per Customer.
- 1.4.2.3 The minimum and maximum number of Securities that are traded by each Account varies by Customer Tier and by the number of Accounts for each Customer. The average number of Securities traded per Account is ten (so the average number of Securities traded per Customer is fifty). For each Account, the same set of Securities is traded for both the initial database population and for any **Test Run**.

1.4.3 Customer Partitioning

- 1.4.3.1 TPC-E scales with Customers. It is conceivable that Customer information could be partitioned into groups of related Customers. This is called Customer Partitioning. The advantage of Customer Partitioning is that it increases locality of reference within each sub-group of Customers. Transactions can be directed to a subset of Customers or to the entire set of Customers, in a defined proportion.

1.4.4 Trade Types

- 1.4.4.1 Trade requests come in two basic flavors: Buy (50%) and Sell (50%). Those are further broken down into Trade Types, depending on whether the request was a Market Order (60%) or a Limit Order (40%).
- 1.4.4.2 For Market Orders, the two trade types are Market-Buy (30%) and Market-Sell (30%). For Limit Orders, the three trade types are Limit-Buy (20%), Limit-Sell (10%) and Stop-Loss (10%).
- 1.4.4.3 Market-Buy and Market-Sell are trade requests to buy and sell immediately at the current market price, whatever price that may be. Limit-Buy is a request to buy only when the market price is at or below the specified limit price. Limit-Sell is a request to sell only when the market price is at or above the specified limit price. Stop-Loss is a request to sell only when (or if) the market price drops to or below the specified limit price.
- 1.4.4.4 If the specified limit price has not been reached when the Limit Order is requested, it is considered an Out-of-the-Money request and remains “Pending” until the specified limit price is reached. Reaching the limit price is guaranteed to occur within 15 minutes based on **EGenDriverMEE** implementation details. The act of noticing that a “Pending” limit request has reached or exceeded its specified limit price and submitting it to the market exchange to be traded is known as triggering of the pending limit order.

1.4.5 Effects of Trading on Holdings

- 1.4.5.1 For a given account and security, holdings will be either all long (positive quantities) or all short (negative quantities).
- 1.4.5.2 Long positions represent shares of the security that were bought (purchased and paid for) by the customer for the account. The customer owns the shares of the security and may sell them at a later time (hopefully, for a higher price).
- 1.4.5.3 Short positions represent shares of the security that were borrowed from the broker (or Brokerage) and were sold by the customer for the account. In the short sale case, the customer has received the funds from that sell, but still has to cover the sell by later purchasing an equal number of shares (hopefully at a lower price) from the market and returning those shares to the broker.
- 1.4.5.4 Before **EGenLoader** runs, there are no trades and no positions in any security for any account. **EGenLoader** simulates running the benchmark for three hundred **Business Days** of initial trading, so that the initial database will be ready for benchmark execution.
- 1.4.5.5 If the first trade for a security in an account is a buy, a long position will be established (positive quantity in HOLDING row). Subsequent buys in the same account for the same security will add holding rows with positive quantities. Subsequent sells will reduce holding quantities or delete holding rows to satisfy the sell trade. All holdings may be eliminated, in which case the position becomes empty. If the sell quantity still is not satisfied, the position changes from long to short (see below).
- 1.4.5.6 If the first trade for a security in an account is a sell, a short position will be established (negative quantity in HOLDING row). Subsequent sells in the same account for the same security will add holding rows with negative quantities. Subsequent buys will reduce holding quantities (toward zero) or delete holding rows to satisfy the buy trade. All holdings may be eliminated, in which case the position becomes empty. If the buy quantity still is not satisfied, the position changes from short to long.

CLAUSE 2 – DATABASE DESIGN, SCALING & POPULATION

2.1 Introduction

The TPC-E database is defined to consist of 33 separate and individual tables. The database schema is organized into four sets of tables:

- **Customer Tables:** This set includes 9 tables that contain information about the customers of the brokerage firm.
- **Broker Tables:** This set includes 9 tables that contain information about the brokerage firm and broker related data.
- **Market Tables:** This set includes 11 tables that contain information about companies, markets, exchanges, and industry sectors.
- **Dimension Tables:** This set includes 4 dimension tables that contain common information such as addresses and zip codes.

The relationship between the tables and the requirements governing their use are outlined in the remaining sections of Clause 2.

2.1.1 Definitions

- 2.1.1.1 A **Primary Key** is a single column or combination of columns that uniquely identifies a row. None of the columns that are part of the **Primary Key** may be nullable. A table must have no more than one **Primary Key**.
- 2.1.1.2 A **Foreign Key (FK)** is a column or combination of columns used to establish and enforce a link between the data in two tables. A link is created between two tables by adding the column or columns that hold one table's **Primary Key** values to the other table. This column becomes a **Foreign Key** in the second table.

2.2 TPC-E Database Schema and Table Definitions

Details of the TPC-E database schema, the data type requirements, the required structure of each individual table, the entity relationship between tables and the individual column restrictions are defined in this clause.

2.2.1 Data Type Definitions

- 2.2.1.1 A **Native Data Type** is a built-in data type of the **DBMS** whose documented purpose is to store data of a particular type described in the specification. For example, **DATETIME** must be implemented with a built-in data type of the **DBMS** designed to store date-time information.
- 2.2.1.2 **CHAR(n)** means a character string that can hold up to n single-byte characters. Strings may be padded with spaces to the maximum length. **CHAR(n)** must be implemented using a **Native Data Type**.
- 2.2.1.3 **NUM(m[,n])** means an unsigned numeric value with at least m total **Digits**, of which n **Digits** are to the right (after) the decimal point. The data type must be able to hold all possible values which can be expressed as **NUM(m[,n])**. Omitting n, as in **NUM(m)**, indicates the same as **NUM(m,0)**. **NUM** must be implemented using a **Native Data Type**.
- 2.2.1.4 **SNUM(m[,n])** is identical to **NUM(m[,n])** except that it can represent both positive and negative values. **SNUM** must be implemented using a **Native Data Type**.

Comment: A **SNUM** data type may be used (at the **Sponsor's** discretion) anywhere a **NUM** data type is specified.

- 2.2.1.5 **ENUM(m[n])** or **SENUM(m[n])** means an exact numeric value (unsigned or signed, respectively). **ENUM** and **SENUM** are identical to **NUM** and **SNUM**, respectively, except that they must be implemented using a **Native Data Type** which provides exact representation of at least n **Digits** of precision after the decimal place.

Comment: A numeric data type provides either exact or approximate representation of numeric values. For example, **INTEGER** and **DECIMAL** are exact numeric data types and **REAL** and **FLOAT** are approximate numeric data types (based on ANSI SQL definitions).

- 2.2.1.6 **BOOLEAN** is a data type capable of holding at least two distinct values that represent FALSE and TRUE.

Comment: The convention in this document, as well as the implementation of **EGen**, is that the value zero (0) denotes FALSE and the value one (1) denotes TRUE.

- 2.2.1.7 **DATE** represents the data type of date with a granularity of a day and must be able to support the range of January 1, 1800 to December 31, 2199, inclusive. **DATE** must be implemented using a **Native Data Type**.

Comment: A time component is not required but may be implemented.

- 2.2.1.8 **DATETIME** represents the data type for a date value that includes a time component. The date component must meet all requirements of the **DATE** data type. The time component must be capable of representing the range of time values from 00:00:00 to 23:59:59. Fractional seconds may be implemented, but are not required. **DATETIME** must be implemented using a **Native Data Type**.

- 2.2.1.9 **BLOB(n)** is a data type capable of holding a variable length binary object of n bytes.

- 2.2.1.10 **BLOB_REF** is a data type capable of referencing a **BLOB(n)** object that is stored outside the table on the SUT.

2.2.2 Meta-type Definitions

The following meta-types are defined for ease of notation. These meta-types may be implemented using the underlying data type on which each is defined. There is no requirement to implement the meta-types as user-defined types in the **DBMS**. A meta-type may be implemented using a user-defined type in the **DBMS** as long as the user-defined type incorporates a **Native Data Type** where required and inherits the properties of that **Native Data Type**.

- 2.2.2.1 **IDENT_T** is defined as **NUM(11)** and is used to hold non-trade identifiers.

- 2.2.2.2 **TRADE_T** is defined as **NUM(15)** and is used to hold trade identifiers.

Trade identifiers have the following characteristics:

- They must be unique.
- They may be sparse.
- At load time they are generated by **EGenLoader**.
- At run time they are generated by **Sponsor** provided code.
- The **EGenLoader** code will not associate trade identifiers with Date/time or customer identifier or account identifiers. No assumptions may be made about trade identifier sequencing.

- 2.2.2.3 **FIN_AGG_T** is defined as **SENUM(15,2)** and is used for holding aggregated financial data such as revenue figures, valuations, and asset values.
- 2.2.2.4 **S_PRICE_T** is defined as **ENUM(8,2)** and is used for holding the value of a share price.
- 2.2.2.5 **S_COUNT_T** is defined as **NUM(12)** and is used for holding the aggregate count of shares used in many tables.
- 2.2.2.6 **S_QTY_T** is defined as **SNUM(6)** and is used for holding the quantity of shares per individual trade.
- 2.2.2.7 **BALANCE_T** is defined as **SENUM(12,2)** and is used for holding aggregate account and transaction related values such as account balances, total commissions, etc.
- 2.2.2.8 **VALUE_T** is defined as **SENUM(10,2)** and is used for holding non-aggregated transaction and security related values such as cost, dividend, etc.

2.2.3 General Schema Items

The following table lists the category, prefix and the name for all TPC-E required tables in the benchmark.

Category	Table Name	Table Prefix	Definition
CUSTOMER	ACCOUNT_PERMISSION	AP_	Clause 2.2.4.1
	CUSTOMER	C_	Clause 2.2.4.2
	CUSTOMER_ACCOUNT	CA_	Clause 2.2.4.3
	CUSTOMER_TAXRATE	CX_	Clause 2.2.4.4
	HOLDING	H_	Clause 2.2.4.5
	HOLDING_HISTORY	HH_	Clause 2.2.4.6
	HOLDING_SUMMARY	HS_	Clause 2.2.4.7
	WATCH_ITEM	WI_	Clause 2.2.4.8
	WATCH_LIST	WL_	Clause 2.2.4.9
BROKER	BROKER	B_	Clause 2.2.5.1
	CASH_TRANSACTION	CT_	Clause 2.2.5.2
	CHARGE	CH_	Clause 2.2.5.3
	COMMISSION_RATE	CR_	Clause 2.2.5.4
	SETTLEMENT	SE_	Clause 2.2.5.5
	TRADE	T_	Clause 2.2.5.6
	TRADE_HISTORY	TH_	Clause 2.2.5.7
	TRADE_REQUEST	TR_	Clause 2.2.5.8
	TRADE_TYPE	TT_	Clause 2.2.5.9
MARKET	COMPANY	CO_	Clause 2.2.6.1
	COMPANY_COMPETITOR	CP_	Clause 2.2.6.2
	DAILY_MARKET	DM_	Clause 2.2.6.3
	EXCHANGE	EX_	Clause 2.2.6.4
	FINANCIAL	FI_	Clause 2.2.6.5
	INDUSTRY	IN_	Clause 2.2.6.6

	LAST_TRADE	LT_	Clause 2.2.6.7
	NEWS_ITEM	NI_	Clause 2.2.6.8
	NEWS_XREF	NX_	Clause 2.2.6.9
	SECTOR	SC_	Clause 2.2.6.10
	SECURITY	S_	Clause 2.2.6.11
DIMENSION	ADDRESS	AD_	Clause 2.2.7.1
	STATUS_TYPE	ST_	Clause 2.2.7.2
	TAXRATE	TX_	Clause 2.2.7.3
	ZIP_CODE	ZC_	Clause 2.2.7.4

- 2.2.3.1 The **Primary Key** references defined in this section must be maintained by the database during a **Test Run**. The **Primary Keys** are marked with PK or PK+ in the Relations field for each table definition. PK indicates that the column is the table's **Primary Key** while PK+ indicates that the column is part of a composite (multi-column) **Primary Key**.
- 2.2.3.2 The **Foreign Key** references defined in this section must be maintained by the database during a **Test Run**. The **Foreign Keys** are marked with FK () or FK+ () in the Relations field for each table definition. FK () indicates a single-column **Foreign Key** while FK+ () indicates that the column is part of a composite (multi-column) **Foreign Key**. The table prefix enclosed in the parenthesis indicates the target table for the **Foreign Key** reference.
- 2.2.3.3 The constraints defined in this section must be enforced by the database during a **Test Run**. The constraints are listed in the Constraints column for each table definition.
Comment: Unless a Not Null constraint is present, a column must allow Null.
- 2.2.3.4 For each TPC-E required table, the columns can be implemented in any order, using any physical representation available from the tested system that satisfies the schema data type requirements.

2.2.4 Customer Tables

These groups of tables contain information about customer related data.

2.2.4.1 ACCOUNT_PERMISSION

This table contains information about the access the customer or an individual other than the customer has to a given customer account. Customer accounts may have trades executed on them by more than one person.

Table Prefix: AP_

Column Name	Data Type	Constraints	Relations	Description
AP_CA_ID	IDENT_T	Not Null	PK+ FK (CA_)	Customer account identifier.
AP_ACL	CHAR(4)	Not Null		Access Control List defining the permissions the person has on the customer account.
AP_TAX_ID	CHAR(20)	Not Null	PK+	Tax identifier of the person with access to the customer account.
AP_L_NAME	CHAR(25)	Not Null		Last name of the person with access to the customer account.

AP_F_NAME	CHAR(20)	Not Null		First name of the person with access to the customer account.
-----------	----------	----------	--	---

2.2.4.2 CUSTOMER

This table contains information about the customers of the brokerage firm.

Table Prefix: C_

Column Name	Data Type	Constraints	Relations	Description
C_ID	IDENT_T	Not Null	PK	Customer identifier, used internally to link customer information.
C_TAX_ID	CHAR(20)	Not Null		Customer's tax identifier, used externally on communication to the customer. Is alphanumeric.
C_ST_ID	CHAR(4)	Not Null	FK (ST_)	Customer status type identifier. Identifies if this customer is active or not.
C_L_NAME	CHAR(25)	Not Null		Primary Customer's last name.
C_F_NAME	CHAR(20)	Not Null		Primary Customer's first name.
C_M_NAME	CHAR(1)			Primary Customer's middle name initial
C_GNDR	CHAR(1)			Gender of the primary customer. Valid values 'M' for male or 'F' for Female.
C_TIER	NUM(1)	Not Null in 1,2,3		Customer tier: tier 1 accounts are charged highest fees, tier 2 accounts are charged medium fees, and tier 3 accounts have the lowest fees.
C_DOB	DATE	Not Null		Customer's date of birth.
C_AD_ID	IDENT_T	Not Null	FK (AD_)	Address identifier of the customer's address.
C_CTRY_1	CHAR(3)			Country code for Customer's phone 1.
C_AREA_1	CHAR(3)			Area code for customer's phone 1.
C_LOCAL_1	CHAR(10)			Local number for customer's phone 1.
C_EXT_1	CHAR(5)			Extension number for Customer's phone 1.
C_CTRY_2	CHAR(3)			Country code for Customer's phone 2.
C_AREA_2	CHAR(3)			Area code for Customer's phone 2.
C_LOCAL_2	CHAR(10)			Local number for Customer's phone 2.
C_EXT_2	CHAR(5)			Extension number for Customer's phone 2.
C_CTRY_3	CHAR(3)			Country code for Customer's phone 3.
C_AREA_3	CHAR(3)			Area code for Customer's phone 3.
C_LOCAL_3	CHAR(10)			Local number for Customer's phone 3.
C_EXT_3	CHAR(5)			Extension number for Customer's phone 3.
C_EMAIL_1	CHAR(50)			Customer's e-mail address 1.
C_EMAIL_2	CHAR(50)			Customer's e-mail address 2.

2.2.4.3 CUSTOMER_ACCOUNT

The CUSTOMER_ACCOUNT table contains account information related to accounts of each customer.

Table Prefix: CA_

Column Name	Data Type	Constraints	Relations	Description
CA_ID	IDENT_T	Not Null	PK	Customer account identifier.
CA_B_ID	IDENT_T	Not Null	FK (B_)	Broker identifier of the broker who manages this customer account.
CA_C_ID	IDENT_T	Not Null	FK (C_)	Customer identifier of the customer who owns this account.
CA_NAME	CHAR(50)			Name of customer account. Example, "Trish Hogan 401(k)".
CA_TAX_ST	NUM(1)	Not Null in 0,1,2		Tax status of this account: 0 means this account is not taxable, 1 means this account is taxable and tax must be withheld, 2 means this account is taxable and tax does not have to be withheld.
CA_BAL	BALANCE_T	Not Null		Account's cash balance.

2.2.4.4 CUSTOMER_TAXRATE

The table contains two references per customer into the TAXRATE table. One reference is for state/province tax; the other one is for national tax. The TAXRATE table contains the actual tax rates.

Table Prefix: CX_

Column Name	Data Type	Constraints	Relations	Description
CX_TX_ID	CHAR(4)	Not Null	PK+ FK (TX_)	Tax rate identifier.
CX_C_ID	IDENT_T	Not Null	PK+ FK (C_)	Customer identifier of a customer that must pay this tax rate.

2.2.4.5 HOLDING

The table contains information about the customer account's security holdings.

Table Prefix: H_

Column Name	Data Type	Constraints	Relations	Description
H_T_ID	TRADE_T	Not Null	PK FK (T_)	Trade Identifier of the trade.
H_CA_ID	IDENT_T	Not Null	FK+ (HS_)	Customer account identifier.
H_S_SYMB	CHAR(15)	Not Null	FK+ (HS_)	Symbol for the security held.
H_DTS	DATETIME	Not Null		Date this security was purchased or sold.
H_PRICE	S_PRICE_T	Not Null > 0		Unit purchase price of this security.
H_QTY	S_QTY_T	Not Null		Quantity of this security held.

2.2.4.6 HOLDING_HISTORY

The table contains information about holding positions that were inserted, updated or deleted and which trades made each change.

Table Prefix: HH_

Column Name	Data Type	Constraints	Relations	Description
HH_H_T_ID	TRADE_T	Not Null	PK+ FK (T_)	Trade Identifier of the trade that originally created the holding row. This is a Foreign Key to the TRADE table rather than the HOLDING table because the HOLDING row could be deleted.
HH_T_ID	TRADE_T	Not Null	PK+ FK (T_)	Trade Identifier of the current trade (the one that last inserted, updated or deleted the holding identified by HH_H_T_ID).
HH_BEFORE_QTY	S_QTY_T	Not Null		Quantity of this security held before the modifying trade. On initial insertion, HH_BEFORE_QTY is 0.
HH_AFTER_QTY	S_QTY_T	Not Null		Quantity of this security held after the modifying trade. If the HOLDING row gets deleted by the modifying trade, then HH_AFTER_QTY is 0.

2.2.4.7 HOLDING_SUMMARY

The table contains aggregate information about the customer account's security holdings.

Table Prefix: HS_

Column Name	Data Type	Constraints	Relations	Description
HS_CA_ID	IDENT_T	Not Null	PK+ FK (CA_)	Customer account identifier.
HS_S_SYMB	CHAR(15)	Not Null	PK+ FK (S_)	Symbol for the security held.
HS_QTY	S_QTY_T	Not Null		Total quantity of this security held.

Comment: HOLDING_SUMMARY may be implemented as a view on HOLDING, in which case the HOLDING **Foreign Key** references to HOLDING_SUMMARY are automatically met. However, the HOLDING_SUMMARY **Foreign Key** references to CA_ and S_ must then be adopted and met by HOLDING.

2.2.4.8 WATCH_ITEM

The table contains list of securities to watch for a watch list.

Table Prefix: WI_

Column Name	Data Type	Constraints	Relations	Description
WI_WL_ID	IDENT_T	Not Null	PK+ FK (WL_)	Watch list identifier.
WI_S_SYMB	CHAR(15)	Not Null	PK+ FK (S_)	Symbol of the security to watch.

2.2.4.9 WATCH_LIST

The table contains information about the customer who created this watch list.

Table Prefix: WL_

Column Name	Data Type	Constraints	Relations	Description

WL_ID	IDENT_T	Not Null	PK	Watch list identifier.
WL_C_ID	IDENT_T	Not Null	FK (C_)	Identifier of customer who created this watchlist.

2.2.5 Broker Tables

This group of tables contains data related to the brokerage firm and brokers.

2.2.5.1 BROKER

The table contains information about brokers.

Table Prefix: B_

Column Name	Data Type	Constraints	Relations	Description
B_ID	IDENT_T	Not Null	PK	Broker identifier.
B_ST_ID	CHAR(4)	Not Null	FK (ST_)	Broker status type identifier; identifies if this broker is active or not.
B_NAME	CHAR(49)	Not Null		Broker's name.
B_NUM_TRADES	NUM(9)	Not Null		Number of trades this broker has executed so far.
B_COMM_TOTAL	BALANCE_T	Not Null		Amount of commission this broker has earned so far.

2.2.5.2 CASH_TRANSACTION

The table contains information about cash transactions.

Table Prefix: CT_

Column Name	Data Type	Constraints	Relations	Description
CT_T_ID	TRADE_T	Not Null	PK FK (T_)	Trade identifier.
CT_DTS	DATETIME	Not Null		Date and time stamp of when the transaction took place.
CT_AMT	VALUE_T	Not Null		Amount of the cash transaction.
CT_NAME	CHAR(100)			Transaction name, or description: e.g. "Buy Keebler Cookies", "Cash from sale of DuPont stock".

2.2.5.3 CHARGE

The table contains information about charges for placing a trade request. Charges are based on the customer's tier and the trade type.

Table Prefix: CH_

Column Name	Data Type	Constraints	Relations	Description
CH_TT_ID	CHAR(3)	Not Null	PK+ FK (TT_)	Trade type identifier.
CH_C_TIER	NUM(1)	Not Null in 1,2,3	PK+	Customer's tier.

CH_CHRG	VALUE_T	Not Null >= 0		Charge for placing a trade request.
---------	---------	------------------	--	-------------------------------------

2.2.5.4 COMMISSION_RATE

The commission rate depends on several factors: the tier the customer is in, the type of trade, the quantity of securities traded, and the exchange that executes the trade.

Table Prefix: CR_

Column Name	Data Type	Constraints	Relations	Description
CR_C_TIER	NUM(1)	Not Null in 1,2,3	PK+	Customer's tier. Valid values 1, 2 or 3.
CR_TT_ID	CHAR(3)	Not Null	PK+ FK (TT_)	Trade Type identifier. Identifies the type of trade.
CR_EX_ID	CHAR(6)	Not Null	PK+ FK (EX_)	Exchange identifier. Identifies the exchange the trade is against.
CR_FROM_QTY	S_QTY_T	Not Null >= 0	PK+	Lower bound of quantity being traded to match this commission rate.
CR_TO_QTY	S_QTY_T	Not Null > CR_FROM_QTY		Upper bound of quantity being traded to match this commission rate.
CR_RATE	NUM(5,2)	Not Null >= 0		Commission rate. Ranges from 0.00 to 100.00. Example: 10% is 10.00.

2.2.5.5 SETTLEMENT

The table contains information about how trades are settled: specifically whether the settlement is on margin or in cash and when the settlement is due.

Table Prefix: SE_

Column Name	Data Type	Constraints	Relations	Description
SE_T_ID	TRADE_T	Not Null	PK FK (T_)	Trade identifier.
SE_CASH_TYPE	CHAR(40)	Not Null		Type of cash settlement involved: possible values "Margin", "Cash Account".
SE_CASH_DUE_DATE	DATE	Not Null		Date by which customer or brokerage must receive the cash; date of trade plus two days.
SE_AMT	VALUE_T	Not Null		Cash amount of settlement.

2.2.5.6 TRADE

The table contains information about trades.

Table Prefix: T_

Column Name	Data Type	Constraints	Relations	Description
T_ID	TRADE_T	Not Null	PK	Trade identifier.
T_DTS	DATETIME	Not Null		Date and time of trade.

T_ST_ID	CHAR(4)	Not Null	FK (ST_)	Status type identifier; identifies the status of this trade.
T_TT_ID	CHAR(3)	Not Null	FK (TT_)	Trade type identifier; identifies the type of his trade.
T_IS_CASH	BOOLEAN	Not Null in 0, 1		Is this trade a cash (1) or margin (0) trade?
T_S_SYMB	CHAR(15)	Not Null	FK (S_)	Security symbol of the security that was traded.
T_QTY	S_QTY_T	Not Null >0		Quantity of securities traded.
T_BID_PRICE	S_PRICE_T	Not Null > 0		The requested unit price.
T_CA_ID	IDENT_T	Not Null	FK (CA_)	Customer account identifier.
T_EXEC_NAME	CHAR(49)	Not Null		Name of the person executing the trade.
T_TRADE_PRICE	S_PRICE_T			Unit price at which the security was traded.
T_CHRG	VALUE_T	Not Null >= 0		Fee charged for placing this trade request.
T_COMM	VALUE_T	Not Null >= 0		Commission earned on this trade; may be zero.
T_TAX	VALUE_T	Not Null >= 0		Amount of tax due on this trade; can be zero. Whether the tax is withheld from the settlement amount depends on the customer account tax status.
T_LIFO	BOOLEAN	Not Null in 0, 1		If this trade is closing an existing position, is it executed against the newest-to-oldest account holdings of this security (1=LIFO) or against the oldest-to-newest account holdings (0=FIFO).

2.2.5.7 TRADE_HISTORY

The table contains the history of each trade transaction through the various states.

Table Prefix: TH_

Column Name	Data Type	Constraints	Relations	Description
TH_T_ID	TRADE_T	Not Null	PK+ FK (T_)	Trade identifier. This value will be used for the corresponding T_ID in the TRADE and SE_T_ID in the SETTLEMENT table if this trade request results in a trade.
TH_DTS	DATETIME	Not Null		Timestamp of when the trade history was updated.
TH_ST_ID	CHAR(4)	Not Null	PK+ FK (ST_)	Status type identifier.

2.2.5.8 TRADE_REQUEST

The table contains information about pending limit trades that are waiting for a certain security price before the trades are submitted to the market.

Table Prefix: TR_

Column Name	Data Type	Constraints	Relations	Description
TR_T_ID	TRADE_T	Not Null	PK FK (T_)	Trade request identifier. This value will be used for processing the pending limit order when it is subsequently triggered.
TR_TT_ID	CHAR(3)	Not Null	FK (TT_)	Trade request type identifier; identifies the type of trade.
TR_S_SYMBOL	CHAR(15)	Not Null	FK (S_)	Security symbol of the security the customer wants to trade.
TR_QTY	S_QTY_T	Not Null > 0		Quantity of security the customer had requested to trade.
TR_BID_PRICE	S_PRICE_T	Not Null > 0		Price the customer wants per unit of security that they want to trade. Value of zero implies the customer wants to trade now at the market price
TR_B_ID	IDENT_T	Not Null	FK (B_)	Identifies the broker handling the trade.

2.2.5.9 TRADE_TYPE

The table contains a list of valid trade types.

Table Prefix: TT_

Column Name	Data Type	Constraints	Relations	Description
TT_ID	CHAR(3)	Not Null	PK	Trade type identifier: Values are: "TMB", "TMS", "TSL", "TLS", and "TLB".
TT_NAME	CHAR(12)	Not Null		Trade type name. Examples "Limit Buy", "Limit Sell", "Market Buy", "Market Sell", "Stop Loss".
TT_IS_SELL	BOOLEAN	Not Null in 0, 1		1 if this is a "Sell" type transaction. 0 if this is a "Buy" type transaction.
TT_IS_MRKT	BOOLEAN	Not Null in 0, 1		1 if this is a market transaction that is submitted to the market exchange emulator immediately. 0 if this is a limit transaction.

The contents of the TRADE_TYPE table are shown below for readability, since the TT_ID values are used elsewhere in the specification.

TT_ID	TT_NAME	TT_IS_SELL	TT_IS_MRKT
TLB	Limit-Buy	0	0
TLS	Limit-Sell	1	0
TMB	Market-Buy	0	1
TMS	Market-Sell	1	1
TSL	Stop-Loss	1	0

2.2.6 Market Tables

This group of tables contains information related to the exchanges, companies, and securities that create the Market.

2.2.6.1 COMPANY

The table contains information about all companies with publicly traded securities.

Table Prefix: CO_

Column Name	Data Type	Constraints	Relations	Description
CO_ID	IDENT_T	Not Null	PK	Company identifier.
CO_ST_ID	CHAR(4)	Not Null	FK (ST_)	Company status type identifier. Identifies if this company is active or not.
CO_NAME	CHAR(60)	Not Null		Company name.
CO_IN_ID	CHAR(2)	Not Null	FK (IN_)	Industry identifier of the industry the company is in.
CO_SP_RATE	CHAR(4)	Not Null		Company's credit rating from Standard & Poor.
CO_CEO	CHAR(46)	Not Null		Name of Company's Chief Executive Officer.
CO_AD_ID	IDENT_T	Not Null	FK (AD_)	Address identifier.
CO_DESC	CHAR(150)	Not Null		Company description.
CO_OPEN_DATE	DATE	Not Null		Date the company was founded.

2.2.6.2 COMPANY_COMPETITOR

This table contains information for the competitors of a given company and the industry in which the company competes.

Table Prefix: CP_

Column Name	Data Type	Constraints	Relations	Description
CP_CO_ID	IDENT_T	Not Null	PK+ FK (CO_)	Company identifier.
CP_COMP_CO_ID	IDENT_T	Not Null	PK+ FK (CO_)	Company identifier of the competitor company for the specified industry.
CP_IN_ID	CHAR(2)	Not Null	PK+ FK (IN_)	Industry identifier of the industry in which the CP_CO_ID company considers that the CP_COMP_CO_ID company competes with it. This may not be either company's primary industry.

2.2.6.3 DAILY_MARKET

The table contains daily market statistics for each security, using the closing market data from the last completed trading day. **EGenLoader** will load this table with data for each security for the period starting 3 January 2000 and ending 31 December 2004.

Table Prefix: DM_

Column Name	Data Type	Constraints	Relations	Description
DM_DATE	DATE	Not Null	PK+	Date of last completed trading day.
DM_S_SYMB	CHAR(15)	Not Null	PK+ FK (S_)	Security symbol of this security.
DM_CLOSE	S_PRICE_T	Not Null		Closing price for this security.
DM_HIGH	S_PRICE_T	Not Null		Day's High price for this security.
DM_LOW	S_PRICE_T	Not Null		Day's Low price for this security.
DM_VOL	S_COUNT_T	Not Null		Day's volume for this security.

2.2.6.4 EXCHANGE

The table contains information about financial exchanges.

Table Prefix: EX_

Column Name	Data Type	Constraints	Relations	Description
EX_ID	CHAR(6)	Not Null	PK	Exchange identifier. Values are, "NYSE", "NASDAQ", "AMEX", "PCX".
EX_NAME	CHAR(100)	Not Null		Exchange name.
EX_NUM_SYMB	NUM(6)	Not Null		Number of securities traded on this exchange.
EX_OPEN	NUM(4)	Not Null		Exchange Daily start time expressed in GMT.
EX_CLOSE	NUM(4)	Not Null		Exchange Daily stop time, expressed in GMT.
EX_DESC	CHAR(150)			Description of the exchange.
EX_AD_ID	IDENT_T	Not Null	FK (AD_)	Mailing address of exchange.

2.2.6.5 FINANCIAL

The table contains information about a company's quarterly financial reports. **EGenLoader** will load this table with financial information for each company for the Quarters starting 1 January 2000 and ending with the quarter that starts 1 October 2004.

Table Prefix: FI_

Column Name	Data Type	Constraints	Relations	Description
FI_CO_ID	IDENT_T	Not Null	PK+ FK (CO_)	Company identifier.
FI_YEAR	NUM(4)	Not Null	PK+	Year of the quarter end.
FI_QTR	NUM(1)	Not Null in 1,2,3,4	PK+	Quarter number that the financial information is for: valid values 1, 2, 3, 4.
FI_QTR_START_DATE	DATE	Not Null		Start date of quarter.
FI_REVENUE	FIN_AGG_T	Not Null		Reported revenue for the quarter.
FI_NET_EARN	FIN_AGG_T	Not Null		Net earnings reported for the quarter.
FI_BASIC_EPS	VALUE_T	Not Null		Basic earnings per share reported for the quarter.
FI_DILUT_EPS	VALUE_T	Not Null		Diluted earnings per share reported for the quarter.
FI_MARGIN	VALUE_T	Not Null		Profit divided by revenues for the quarter.
FI_INVENTORY	FIN_AGG_T	Not Null		Value of inventory on hand at the end of the quarter.
FI_ASSETS	FIN_AGG_T	Not Null		Value of total assets at the end of the quarter.
FI LIABILITY	FIN_AGG_T	Not Null		Value of total liabilities at the end of the quarter.
FI_OUT_BASIC	S_COUNT_T	Not Null		Average number of common shares outstanding (basic).
FI_OUT_DILUT	S_COUNT_T	Not Null		Average number of common shares outstanding (diluted).

2.2.6.6 INDUSTRY

The table contains information about industries. Used to categorize which industries a company is in.

Table Prefix: IN_

Column Name	Data Type	Constraints	Relations	Description
IN_ID	CHAR(2)	Not Null	PK	Industry identifier.
IN_NAME	CHAR(50)	Not Null		Industry name. Examples: "Air Travel", "Air Cargo", "Software", "Consumer Banking", "Merchant Banking", etc.
IN_SC_ID	CHAR(2)	Not Null	FK (SC_)	Sector identifier of the sector the industry is in.

2.2.6.7 LAST_TRADE

The table contains one row for each security with the latest trade price and volume for each security.

Table Prefix: LT_

Column Name	Data Type	Constraints	Relations	Description
-------------	-----------	-------------	-----------	-------------

LT_S_SYMB	CHAR(15)	Not Null	PK FK (S_)	Security symbol.
LT_DTS	DATETIME	Not Null		Date and timestamp of when this row was last updated.
LT_PRICE	S_PRICE_T	Not Null		Latest trade price for this security.
LT_OPEN_PRICE	S_PRICE_T	Not Null		Price the security opened at today.
LT_VOL	S_COUNT_T	Not Null		Volume of trading on the market for this security so far today. Value initialized to 0.

2.2.6.8 NEWS_ITEM

The table contains information about news items of interest.

Table Prefix: NI_

Column Name	Data Type	Constraints	Relations	Description
NI_ID	IDENT_T	Not Null	PK	News item identifier.
NI_HEADLINE	CHAR(80)	Not Null		News item headline.
NI_SUMMARY	CHAR(255)	Not Null		News item summary.
NI_ITEM	BLOB(100000) or BLOB_REF	Not Null		Large object containing the news item or links to the story.
NI_DTS	DATETIME	Not Null		Date and time the news item was published.
NI_SOURCE	CHAR(30)	Not Null		Source of the news item.
NI_AUTHOR	CHAR(30)			Author of the news item. May be null if the news item came off a wire service.

2.2.6.9 NEWS_XREF

The table contains a cross-reference of news items to companies that are mentioned in the news item.

Table Prefix: NX_

Column Name	Data Type	Constraints	Relations	Description
NX_NI_ID	IDENT_T	Not Null	PK+ FK (NI_)	News item identifier.
NX_CO_ID	IDENT_T	Not Null	PK+ FK (CO_)	Company identifier of the company (or one of the companies) mentioned in the news item.

2.2.6.10 SECTOR

The table contains information about market sectors.

Table Prefix: SC_

Column Name	Data Type	Constraints	Relations	Description
SC_ID	CHAR(2)	Not Null	PK	Sector identifier.
SC_NAME	CHAR(30)	Not Null		Sector name. Examples: "Energy", "Materials", "Industrials", "Health Care", etc.

2.2.6.11 SECURITY

This table contains information about each security traded on any of the exchanges.

Table Prefix: S_

Column Name	Data Type	Constraints	Relations	Description
S_SYMB	CHAR(15)	Not Null	PK	Security symbol used to identify the security on "ticker".
S_ISSUE	CHAR(6)	Not Null		Security issue type. Example: "COMMON", "PERF_A", "PERF_B", etc.
S_ST_ID	CHAR(4)	Not Null	FK (ST_)	Security status type identifier. Identifies if this security is active or not.
S_NAME	CHAR(70)	Not Null		Security name.
S_EX_ID	CHAR(6)	Not Null	FK (EX_)	Exchange identifier of the exchange the security is traded on.
S_CO_ID	IDENT_T	Not Null	FK (CO_)	Company identifier of the company this security is issued by.
S_NUM_OUT	S_COUNT_T	Not Null		Number of shares outstanding for this security.
S_START_DATE	DATE	Not Null		Date security first started trading.
S_EXCH_DATE	DATE	Not Null		Date security first started trading on this exchange.
S_PE	VALUE_T	Not Null		Current share price to earnings per share ratio.
S_52WK_HIGH	S_PRICE_T	Not Null		Security share price 52-week high.
S_52WK_HIGH_DATE	DATE	Not Null		Date of security share price 52-week high.
S_52WK_LOW	S_PRICE_T	Not Null		Security share price 52-week low.
S_52WK_LOW_DATE	DATE	Not Null		Date of security share price 52-week low.
S_DIVIDEND	VALUE_T	Not Null		Annual Dividend per share amount. May be zero, is not allowed to be negative.
S_YIELD	NUM(5,2)	Not Null		Dividend to share price ratio. Value is in percent. Example 10.00 is 10%

2.2.7 Dimension Tables

This group of tables includes 4 dimension tables that contain common information such as addresses and zip codes.

2.2.7.1 ADDRESS

This table contains address information.

Table Prefix: AD_

Column Name	Data Type	Constraints	Relations	Description
AD_ID	IDENT_T	Not Null	PK	Address identifier.

AD_LINE1	CHAR(80)			Address Line1.
AD_LINE2	CHAR(80)			Address Line2.
AD_ZC_CODE	CHAR(12)	Not Null	FK (ZC_)	Zip or postal code.
AD_CTRY	CHAR(80)			Country.

2.2.7.2 STATUS_TYPE

This table contains all status values for several different status usages. Multiple tables reference this table to obtain their status values.

Table Prefix: ST_

Column Name	Data Type	Constraints	Relations	Description
ST_ID	CHAR(4)	Not Null	PK	Status type identifier.
ST_NAME	CHAR(10)	Not Null		Status value. Examples: "Active", "Completed", "Pending", "Canceled" and "Submitted".

The contents of the STATUS_TYPE table are shown below for readability, since the ST_ID values are used elsewhere in the specification.

ST_ID	ST_NAME
ACTV	Active
CMPT	Completed
CNCL	Canceled
PNDG	Pending
SBMT	Submitted

2.2.7.3 TAXRATE

The table contains information about tax rates.

Table Prefix: TX_

Column Name	Data Type	Constraints	Relations	Description
TX_ID	CHAR(4)	Not Null	PK	Tax rate identifier. Format - two letters followed by one digit. Examples: 'US1', 'CA1'.
TX_NAME	CHAR(50)	Not Null		Tax rate name.
TX_RATE	NUM(6,5)	Not Null >= 0		Tax rate, between 0.00000 and 1.00000, inclusive.

2.2.7.4 ZIP_CODE

The table contains zip and postal codes, towns, and divisions that go with them.

Table Prefix: ZC_

Column Name	Data Type	Constraints	Relations	Description
ZC_CODE	CHAR(12)	Not Null	PK	Postal code.
ZC_TOWN	CHAR(80)	Not Null		Town.
ZC_DIV	CHAR(80)	Not Null		State or province or county.

2.3 Implementation Rules

- 2.3.1 The physical clustering of records within the database is allowed.
- 2.3.2 All TPC-E required tables must have the properly scaled number of rows as defined by the database population requirements in Clause 2.6.
- 2.3.3
 - 2.3.3.1 Horizontal partitioning of tables is allowed. Groups of rows from a table may be assigned to different files, disks, or areas. If implemented, the details of such partitioning must be **reported** in the **Report**.
 - 2.3.3.2 Vertical partitioning of tables is allowed. Groups of columns of one table may be assigned to files, disks, or areas different from those storing the other columns of that table. If implemented, the details of such partitioning must be **reported** in the **Report** (see Clause 2.5 for limitations).
 - 2.3.3.3 Assignment of data to different files, disks, or areas, not based on knowledge of the logical structure of the data (e.g., knowledge of row or column boundaries), is not considered partitioning. For example, distribution or striping over multiple disks of a physical file which stores one or more logical tables is not considered partitioning as long as this distribution is done by the hardware or software without knowledge of the logical structure stored in the physical file.
- 2.3.4 Replication is allowed for all tables. All copies of TPC-E tables that are replicated must meet all requirements for atomicity, consistency, and isolation as defined in Clauses 7.2, 7.3 and 7.4. If implemented, the details of such replication must be **reported** in the **Report**.

Comment: Only one copy of a replicated TPC-E table needs to meet the **Durability** requirements defined in Clause 7.5.
- 2.3.5 Columns may be added and/or duplicated from one TPC-E table to another as long as these changes do not improve performance.
- 2.3.6 Each TPC-E column, as described by the table definitions in Clause 2.2, must be logically discrete and independently accessible by the **DBMS**. For example, ADDRESS.AD_LINE1 and ADDRESS.AD_LINE2 are not allowed to be implemented as two sub-parts of a single column ADDRESS.AD_LINE.
- 2.3.7 Each TPC-E column, as described by the table definitions in Clause 2.2, must be accessible by the **DBMS** as a single column. For example, NEWS_ITEMS.NI_ITEM is not allowed to be implemented as two separate columns NEWS_ITEMS.NI_ITEM1 and NEWS_ITEMS.NI_ITEM2.

2.3.8 The **Primary Key** of each table must not directly represent the physical disk addresses of the row or any offsets thereof. The **Application** is not allowed to reference rows using relative addressing since they are simply offsets from the beginning of the storage space. This does not preclude hashing schemes or other file organizations that have provisions for adding, deleting, and modifying records in the ordinary course of processing.

Comment 1: It is the intent of this clause that the **Application Program** (see Clause 1.2) executing the transaction, or submitting the transaction request, not use physical identifiers, but logical identifiers for all accesses, and contain no user written code which translates or aids in the translation of a logical key to the location within the table of the associated row or rows. For example, it is not legitimate for the **Application** to build a "translation table" of logical-to-physical addresses and use it to enhance performance.

Comment 2: Internal record or row identifiers, for example, Tuple IDs or cursors, may be used under the following condition. For each transaction executed, initial access to any row must be via the column(s) specified in the transaction **Profile** and no other columns. Initial access includes insertion, deletion, retrieval, and update of any row.

2.3.9 While inserts and deletes are not performed on all tables, the system must not be configured to take special advantage of this fact during the test. Although inserts are inherently limited by the storage space available on the configured system, there must be no restriction on inserting in any of the **Non-Growing Tables** a minimum number of rows equal to 5% of the table cardinality.

Comment: It is required that the space for the additional 5% table cardinality (and corresponding growth in associated **User-Defined Objects**, such as indices) be configured for the **Test Run** and priced (as **Fixed Space** per Clause 6.6.6.3) accordingly. For systems where space is configured and dynamically allocated at a later time, this space must be considered as allocated and included as **Fixed Space** when priced.

2.3.10 The implementation of the BLOB object must satisfy the following properties:

- Changes to the data in the object must be under the same transactional control as the changes to the objects of any other type.
- Recovery after **Catastrophic** failure must be capable of restoring all objects, including BLOBS, to the same point in time.
- The object, and any associated references to it, must be treated as a unit with respect to atomicity.

Comment: The implementation of BLOB in the NEWS_ITEM table may be implemented either by specific inclusion of the BLOB in the table or by use of a reference to a BLOB object stored elsewhere on the **System Under Test**.

2.3.11 **User-Defined Objects**

Any object defined in the database is considered a **User-Defined Object**, except for the following:

- a TPC-E Table (see clause 2.2.3)
- a required **Primary Key** (see clause 2.2.3.1)
- a required **Foreign Key** (see clause 2.2.3.2)
- a required constraint (see clause 2.2.3.3)
- **Database Metadata**

2.3.11.1 There are no restrictions on **User-Defined Objects**, provided that:

- all **Transaction** and **Frame** implementation rules from clause 3.2 are met

- all **ACID** requirements in clause 7 are met

2.4 Integrity Rules

- 2.4.1 In any **Committed** state, the **Primary Key** values must be unique within each table. For example, in the case of a horizontally partitioned table, **Primary Key** values of rows across all partitions must be unique.
- 2.4.2 In any **Committed** state, no ill-formed rows may exist in the database. An ill-formed row occurs when the value of any column cannot be determined. For example, in the case of a vertically partitioned table, a row must exist in all the partitions.
- 2.4.3 **Referential Integrity** (RI) must be enforced by the database for all **Foreign Key** (FK) and **Primary Key** (PK) relations defined between TPC-E tables.

Comment: **Referential Integrity** preserves the relationship of data between tables, by restricting actions performed on **Primary Keys** and **Foreign Keys** in a table. **Referential Integrity** prevents removing rows containing **Primary Keys** that are referenced by **Foreign Keys** in other tables in the database without also removing the rows with corresponding/referencing **Foreign Keys**. **Referential Integrity** also prevents adding rows containing **Foreign Keys** that refer to **Primary Keys** whose rows are not already present in the database. **Referential Integrity** does not allow modifications to **Primary Key** columns of rows that are referenced by **Foreign Keys** in other tables in the database without also modifying the corresponding/referencing **Foreign Keys** to be equal to the new **Primary Key**.

2.5 Data Access Transparency Requirements

Data Access Transparency is the property of the system that removes from the **Application Program** any knowledge of the location and access mechanisms of partitioned data. An implementation that uses vertical and/or horizontal partitioning must meet the requirements for transparent data access described here.

No finite series of tests can prove that the system supports complete data access transparency. The requirements below describe the minimum capabilities needed to establish that the system provides transparent data access.

Comment: The intent of this clause is to require that access to physically and/or logically partitioned data be provided directly and transparently by services implemented by commercially available layers below the **Application Program** such as the data/file manager (**DBMS**), the **Operating System**, the hardware, or any combination of these.

- 2.5.1 Each of the tables described in Clause 2.2 (and any additional tables used in the implementation of the **Transactions**) must be identifiable by names that have no relationship to the partitioning of tables. All data manipulation operations in the **Application Program** (see Clause 1.2) must use only these names.
- 2.5.2 The system must prevent any data manipulation operation performed using the names described in Clause 2.5.1 that would result in a violation of the integrity rules (see Clause 2.4). For example: the system must prevent a non-TPC-E application from committing the insertion of a row in a vertically partitioned table unless all partitions of that row have been inserted.
- 2.5.3 Using the names which satisfy Clause 2.5.1, any arbitrary non-TPC-E application must be able to manipulate any set of rows or columns:

- Identifiable by any arbitrary condition supported by the underlying **DBMS**
- Using the names described in Clause 2.5.1 and using the same data manipulation semantics and syntax for all tables.

For example, the semantics and syntax used to update an arbitrary set of rows in any one table must also be usable when updating another arbitrary set of rows in any other table.

Comment: The intent is that the TPC-E **Application Program** uses general-purpose mechanisms to manipulate data in the database.

2.6 TPC-E Database Size and Table Cardinality

The transaction load generated to service customer accounts and to interact with financial markets drives the throughput of the TPC-E benchmark. To increase the throughput, more customers and their associated data must be configured. The cardinality of the CUSTOMER table is the basis of the TPC-E database size and scaling. CUSTOMER table cardinality is determined based on the transaction throughput metric requirements defined in Clause 6.6.7.

Configured Customers means the number of customers (with corresponding rows in the associated TPC-E tables) configured at database generation.

The TPC-E benchmark has three types of sizing requirements for its tables:

- **Fixed Tables:** These tables always have the same number of rows regardless of the database size and transaction throughput. For example, TRADE_TYPE has five rows.
- **Scaling Tables:** These tables each have a defined cardinality that has a constant relationship to the cardinality of the CUSTOMER table. **Transactions** may update rows from these tables, but the table sizes remain constant.
- **Growing Tables:** These tables each have an initial cardinality that has a defined relationship to the cardinality of the CUSTOMER table. However, the cardinality increases with new growth during the benchmark run at a rate that is proportional to transaction throughput rates.

Comment: The HOLDING and HOLDING_SUMMARY tables are considered **Growing Tables**. Rows are added and deleted from the HOLDING and HOLDING_SUMMARY tables during the benchmark execution, but the average size of the tables continues to grow at an insignificant rate during **Steady State**. The TRADE_REQUEST table is also considered a **Growing Table**, even though its average size is a fixed relationship to the transaction throughput rates and not to the cardinality of the CUSTOMER table.

2.6.1 Initial Database Size Requirements

- 2.6.1.1 The test database must be initially populated using data generated by **EGenLoader**. By definition, the TPC provided **EGenLoader** produces the correct number of rows for each table. The test database must be built including the initial database population and **User-Defined Objects** present immediately prior to the first **Test Run**.
- 2.6.1.2 The initial database population is based on the number of customers. The benchmark **Sponsor** selects the CUSTOMER table cardinality, based on the desired transaction throughput. Clause 6.6.8.2 defines the **Nominal Throughput** for a given number of rows in the CUSTOMER table. The minimum number of rows for the CUSTOMER table is 5000. The size of the CUSTOMER table can be increased in increments of 1000 customers. A set of 1000 customers is known as a **Load Unit**.
- 2.6.1.3 The **Growing Tables** are populated with an initial set of rows sufficient to enable all benchmark **Transactions** to run.

- 2.6.1.4 The **Scale Factor** is the number of required customer rows per single **Transactions-Per-Second-E** (tpsE). The **Scale Factor** for **Nominal Throughput** is 500.
- 2.6.1.5 The **Initial Trade Days (ITD)** is the number of **Business Days** used to populate the database. This population is made of trade data that would be generated by the **SUT** when running at the **Nominal Throughput** for the specified number of **Business Days**. The number of **Initial Trade Days** is 300.
- 2.6.1.6 The number of **Load Units** configured must be equal to the number of **Load Units** actually accessed during the **Test Run**.
- 2.6.1.7 The following variables are used as an aid in defining TPC-E table cardinalities:

Variable	Table	Description
<i>customers</i>	CUSTOMER	Number of rows in the CUSTOMER table.
<i>accounts</i>	CUSTOMER_ACCOUNT	Number of rows in the CUSTOMER_ACCOUNT table. Equal to 5 * <i>customers</i> .
<i>trades</i>	TRADE	Number of trade rows in the TRADE table. The trades number is equal to 17280 * <i>customers</i> (300 days of initial population at SF = 500).
<i>settled</i>	SETTLEMENT	Number of settled trade rows in the SETTLEMENT table. The settled number is equal to <i>trades</i> .
<i>companies</i>	COMPANY	Number of rows in the COMPANY table. 500 companies per Load Unit of 1000 customers.
<i>securities</i>	SECURITY	Number of rows in the SECURITY table. 685 securities per Load Unit of 1000 customers.

- 2.6.1.8 The following rules are used by **EGenLoader** to calculate the cardinalities of the **Scaling Tables** and **Growing Tables**. The **EGen** package uses random number generators to set the number of rows for relationships such as securities per account and, as a result, the cardinality of some TPC-E tables can only be approximated.

Table	Variable Used	Rule
ACCOUNT_PERMISSION	<i>accounts</i>	60% have just the customer as the executor 38% have the customer and 1 other executor 2% have the customer and 2 other executors Avg. is ~1.42 * <i>accounts</i>
ADDRESS	<i>customers</i>	<i>companies</i> + EXCHANGE(4) + <i>customers</i>
BROKER	<i>customers</i>	0.01 * <i>customers</i> (or 1 broker per 100 <i>customers</i>)
CASH_TRANSACTION	<i>settled</i>	~0.92 * <i>settled</i> (84% of buys and 100% of sells are cash)
COMPANY	<i>customers</i>	500 * (<i>customers</i> /1000)
COMPANY_COMPETITOR	<i>companies</i>	3 * <i>companies</i>
CUSTOMER_ACCOUNT	<i>customers</i>	5 * <i>customers</i>
CUSTOMER_TAXRATE	<i>customers</i>	2 * <i>customers</i>
DAILY_MARKET	<i>securities</i>	<i>securities</i> * 1,305 (5 years of 5-day work weeks with two leap years)
FINANCIAL	<i>companies</i>	<i>companies</i> * 20 quarters (5 years)
HOLDING	<i>settled</i>	~0.051 * <i>settled</i> (assumes ITD = 300 and SF = 500)

HOLDING_HISTORY	<i>settled</i>	$\sim 1.340 * \text{settled}$ (assumes ITD = 300 and SF = 500)
HOLDING_SUMMARY	<i>accounts</i>	$\sim 9.956 * \text{accounts}$ (assumes ITD = 300 and SF = 500)
LAST_TRADE	<i>securities</i>	$1 * \text{securities}$
NEWS_ITEM	<i>companies</i>	$2 * \text{companies}$
NEWS_XREF	<i>companies</i>	$2 * \text{companies}$
SECURITY	<i>customers</i>	$685 * (\text{customers}/1000)$
SETTLEMENT	<i>settled</i>	$1 * \text{settled}$
TRADE	<i>customers</i>	$17280 * \text{customers} = ((\text{ITD} * 8 * 3600) / \text{SF}) * \text{customers}$
TRADE_HISTORY	<i>settled</i>	$\sim ((2 \text{ rows per market trade}) * 0.6) + ((3 \text{ rows per limit trade}) * 0.4)$ Average is $(2.4 * \text{settled})$
TRADE_REQUEST		0
WATCH_LIST	<i>customers</i>	Each customer has one watch list ($1 * \text{customers}$)
WATCH_ITEM	<i>customers</i>	Average=100 items per watch list * <i>customers</i>

2.6.1.9 The following list contains the cardinality of **Fixed Tables**.

Fixed Tables	Cardinality	Cardinality Formula
CHARGE	15	5 trade types * 3 customer tiers
COMMISSION_RATE	240	4 rates * 4 exchanges * 5 trade types * 3 customer tiers
EXCHANGE	4	4 exchanges
INDUSTRY	102	102 industries
SECTOR	12	12 sectors
STATUS_TYPE	5	5 status types
TAXRATE	320	320 tax rates
TRADE_TYPE	5	5 trade types
ZIP_CODE	14,741	14,741 zip codes

2.6.1.10 The following list contains the cardinality of the **Scaling Tables**.

Scaling Tables	Cardinality	Cardinality Formula
CUSTOMER	5,000	Scaled based on transaction rate
CUSTOMER_TAXRATE	10,000	<i>customers</i> * 2
CUSTOMER_ACCOUNT	25,000	<i>accounts</i> = (5 * <i>customers</i>)
ACCOUNT_PERMISSION	$\sim 35,500$	<i>accounts</i> * (Average of ~ 1.42 permissions per account)
ADDRESS	7,504	<i>companies</i> + EXCHANGE (4) + <i>customers</i>
BROKER	50	<i>customers</i> * 0.01
COMPANY	2,500	$500 * (\text{customers}/1000)$

COMPANY_COMPETITOR	7,500	<i>companies</i> * 3
DAILY_MARKET	4,469,625	<i>securities</i> * 1,305
FINANCIAL	50,000	<i>companies</i> * 20
LAST_TRADE	3,425	<i>securities</i> * 1
NEWS_ITEM	5,000	<i>companies</i> * 2
NEWS_XREF	5,000	<i>companies</i> * 2
SECURITY	3,425	685 * (<i>customers</i> / 1000)
WATCH_LIST	5,000	<i>customers</i> * 1
WATCH_ITEM	~ 500,000	<i>customers</i> * (Average of ~100 <i>securities</i> per watch list)

- 2.6.1.11 The following list shows the initial cardinality of the **Growing Tables**.

Growing Tables	Cardinality	Cardinality Formula
CASH_TRANSACTION	~79,488,000	~0.92 * <i>settled</i> (84% of buys & 100% of sells are cash)
HOLDING	~4,406,400	~0.051 * <i>settled</i> (assumes ITD = 300 and SF = 500)
HOLDING_HISTORY	~115,776,000	~1.340 * <i>settled</i> (assumes ITD = 300 and SF = 500)
HOLDING_SUMMARY	~248,900	~9.956 * <i>accounts</i>
SETTLEMENT	86,400,000	1 * <i>settled</i>
TRADE	86,400,000	((ITD * 8hr/day * 3600sec/hr * <i>customers</i>) / SF)
TRADE_HISTORY	~207,360,000	~(2.4 * <i>trades</i>)
TRADE_REQUEST	0	0

2.6.2 Test Run Database Size Requirements

- 2.6.2.1 The following list shows the increase in rows per second for the **Growing Tables** (except for TRADE_REQUEST) during a **Test Run**. The rate of growth may decline after running for a large number of days.

Table Name	Cardinality Formula
CASH_TRANSACTION	~0.92 * (<i>customers</i> / SF)
HOLDING	~0.044 * (<i>customers</i> / SF)
HOLDING_HISTORY	~1.343 * (<i>customers</i> / SF)
SETTLEMENT	1 * (<i>customers</i> / SF)
TRADE	1 * (<i>customers</i> / SF)
TRADE_HISTORY	~2.4 * (<i>customers</i> / SF)

The TRADE_REQUEST table is empty at the start of a **Test Run** and does grow at first during runtime, but it soon reaches a cardinality that is dependent on recent performance and not on the length of the **Test Run**. The approximate cardinality of TRADE_REQUEST during the **Steady State** portion of a **Test Run** can be estimated as ~60 rows * **Measured Throughput** (see Clause 6.6.8.4). Considerable variation in this cardinality is possible both while running and at the end of a **Test Run**.

- 2.6.2.2 The test database must be built to sustain the **Reported Throughput** during a **Business Day**. This means that test database must have a **Business Day's** worth of additional space for data, index and log online. This excludes performing on the database any operation that does not occur during the **Measurement Interval**.

CLAUSE 3 – TRANSACTIONS

3.1 Introduction

The core of each TPC-E **Transaction** runs on the **Database Server**, but the logic of the **Transaction** interacts with several components of the benchmark environment. This section defines all aspects of the **Transactions**, including side effects on other components of the benchmark environment.

3.1.1 Definitions

- 3.1.1.1 A **Transaction** is composed of **EGenTxnHarness** and of the invocation of one or more **Frames**. The Trade-Cleanup **Transaction** is an exception. **Sponsors** may but do not have to run the Trade-Cleanup **Transaction** from **EGenTxnHarness**.
- 3.1.1.2 The **EGenTxnHarness** is the TPC provided transaction logic, which the **Sponsor** is not allowed to alter. The **EGenTxnHarness** is implemented in a manner that precludes the consolidation of multiple **Frames** within a **Transaction**.
- 3.1.1.3 A **Frame** is the **Sponsor** implemented **Transaction** logic, which is invoked as a unit of execution by the **EGenTxnHarness**. The database interactions of a **Transaction** are all initiated from within its **Frames**.

Figure 3.a - Frames Interfacing with the Harness and the Database

- 3.1.1.4 A **Database Transaction** is an ACID unit of work.

3.1.2 Database Footprint Definition

This Clause describes the format used to specify the **Database Footprint** of each **Transaction** in this benchmark.

- 3.1.2.1 The **Database Footprint** of a **Transaction** is the set of required database interactions to be executed by that **Transaction**.
- 3.1.2.2 Each **Database Footprint** is presented in a tabular format where the columns specify the following:
- The first column denotes either one of the database tables defined in Clause 2.2 or the words “Transaction Control” that denotes the entire **Transaction**. The last row defines the overall **Transaction**.
 - The second column denotes one of the following:
 - A specific column name of a database table as defined in Clause 2.2.
 - The string “# rows” that specifies the exact number of rows containing all columns of a database table. For example, “2 rows” indicates two complete rows of a database table.
 - The string “Row(s)” that specifies a variable number of rows containing all columns of a database table.
 - The remaining columns correspond with each of the **Frames** of the **Transaction** and contain the database interactions or **Transaction** control operations required to be executed in that **Frame**.

- 3.1.2.3 The following table is an example of the **Database Footprint** of a **Transaction**.

Example Database Footprint				
Table	Column	Frame		
		1	2*	3*
CUSTOMER_ACCOUNT	CA_BAL	Reference		
	CA_C_ID	Return		
	CA_TAX_ST	Return		
HOLDING	H_PRICE		Return	
	H_QTY		Modify	
	Row(s)		Remove *	
	1 row		Add *	
TRADE_HISTORY	1 row			Add
Transaction Control		Start	Rollback *	Commit

- For the last row of the **Database Footprint** where the words “Transaction Control” appears, each column corresponds to one of the **transaction Frames**. The content of the columns denote which **Transaction** control operations occur in that **Frame**. The possible **Transaction** control operations are as follows:
 - The word “Start” indicates that the specified **Frame** contains a control operation that starts a **Database Transaction**. The start of a **Database Transaction** can only occur in a **Frame** where the word “Start” is specified.
 - The word “Rollback” indicates that the specified **Frame** contains a control operation that rolls back the **Database Transaction**. The explicit rolling back of a **Database Transaction** can only occur in a **Frame** where the word “Rollback” is specified.

The word “Commit” indicates that the specified **Frame** contains a control operation that commits a **Database Transaction**. **Commit**: a control operation that:

- Is initiated by a unit of work (a **Transaction**)
- Is implemented by the **DBMS**

- Signifies that the unit of work has completed successfully and all tentatively modified data are to persist (until modified by some other operation or unit of work)
 - Upon successful completion of this control operation both the **Transaction** and the data are said to be **Committed**. The explicit committing of a **Database Transaction** can only occur in a **Frame** where the word “**Commit**” is specified.
- Comment: Multiple **Transaction** control operations may occur within the same **Frame**. For example, a **Transaction** that consists of a single **Frame** would have both “**Start**” and “**Commit**” in its **Database Footprint** column corresponding with **Frame 1**.
- For remaining rows of the **Database Footprint** the column corresponding to each **Frame** contains the access method required for the table column listed in that row. The possible access methods are as follows:
 - The word “**Reference**” indicates that the TPC-E table column is identified in the database and the content is accessed within the **Frame** without passing the content of the table column to the **EGenTxnHarness**.
 - The word “**Return**” indicates that the TPC-E table column is referenced and that its content is retrieved from the database and passed to the **EGenTxnHarness**. The table column must be referenced in the same **Frame** where the word “**Return**” is specified. The content of the table column can only be passed to subsequent **Frames** via the input and output parameters specified in the **Frame** parameters.
 - The word “**Modify**” indicates that the content of a TPC-E table column is modified within the **Frame**. The content of the table column can only be changed in a **Frame** where the word “**Modify**” is specified. When the original content of the table column must also be referenced or returned before it is modified, a “**Reference**” or a “**Return**” access method is also specified.
 - The word “**Add**” indicates that a number of rows are added to the TPC-E table specified by the **Database Footprint**. TPC-E Table row(s) can only be added in a **Frame** where the word “**Add**” is specified. The number of rows that are added is specified in the second column of the **Database Footprint** with either “# **row**” for a fixed number of rows or “**row(s)**” for an unspecified number of rows.
 - The word “**Remove**” indicates that a number of rows are removed from the TPC-E table specified by the **Database Footprint**. Table row(s) can only be removed in a **Frame** where the word “**Remove**” is specified. The number of rows that are removed is specified in the second column of the **Database Footprint** with either “# **row**” for a fixed number of rows or “**row(s)**” for an unspecified number of rows.

Comment 1: An asterisk following any item in the column of a given **Frame** denotes that the transaction control, the database interactions, or the execution of the entire **Frame** is conditional. The **EGenTxnHarness** defines under which conditions the **Frame** will be executed.

Comment 2: In the example **Database Footprint** above, the **Database Transaction** is started in **Frame 1**. If **Frame 2** is executed the **Database Transaction** may be rolled back. If **Frame 3** is executed the **Database Transaction** must be **Committed**. For the table CUSTOMER_ACCOUNT, the table column CA_BAL is referenced and the table columns CA_C_ID and CA_TAX_ST are returned in **Frame 1**. For the HOLDING table, the column H_PRICE is returned and H_QTY is modified if **Frame 2** is executed. Additionally, if **Frame 2** is executed, a number of rows are conditionally removed from the HOLDING table and 1 row is conditionally added to the HOLDING table. For the TRADE_HISTORY table, a row is added if **Frame 3** is executed.

Comment 3: The programming semantics used to implement the required access methods for a given table column is not restricted from performing operations typically associated with a different access method, as long as the implementation of the **Frame** is functionally equivalent to the specified **Pseudo-code**. For example, “select for update” and “select with UPDLOCK” are compliant implementations of a **Reference** access method.

3.2 Transaction Implementation Rules

3.2.1 Frame Implementation

- 3.2.1.1 The implementation of a **Frame** is not allowed to assume any prior knowledge of **EGen**'s data generation methods or values for data elements defined in the database schema for the benchmark, except for the **EGen** constants listed in the table below.

Comment 1: The intent of this clause is to prevent the **Frames** from using constant values, or other means, to circumvent database references to static or infrequently changing data elements. In general, using any private knowledge specific to the benchmark, but which is not explicitly furnished to the **Transaction** or the **Frame**, via **Transaction** inputs or **Transaction Pseudo-code**, is prohibited.

- 3.2.1.2 The following table shows **EGen** constants used as limits when generating the number of values for **Transaction** inputs or when accepting **Transaction** outputs. These constant limits are provided in the specification for explicit usage in the corresponding Clause 3.3 **Frame Implementations**.

Description	Constant	Value	EGen Filename
Broker-Volume			
Minimum number of input broker names	min_broker_list_len	20	TxnHarnessStructs.h
Maximum number of input broker names	max_broker_list_len	40	TxnHarnessStructs.h
Customer-Position			
Maximum customer accounts per customer	max_acct_len	10	TxnHarnessStructs.h
Maximum number of TRADE_HISTORY rows to return	max_hist_len	30	TxnHarnessStructs.h
Market-Feed			
Maximum number of items on the ticker	max_feed_len	20	TxnHarnessStructs.h
Security-Detail			
Minimum number of DAILY_MARKET rows to return	min_day_len	5	TxnHarnessStructs.h
Maximum number of DAILY_MARKET rows to return	max_day_len	20	TxnHarnessStructs.h
Maximum number of FINANCIAL rows to return	max_fin_len	20	TxnHarnessStructs.h
Maximum number of NEWS_ITEM rows to return	max_news_len	2	TxnHarnessStructs.h
Maximum number of COMPANY_COMPETITOR rows to return	max_comp_len	3	TxnHarnessStructs.h
Trade-Lookup			
Maximum number of TRADE rows to return for Transaction	TradeLookupMaxRows	20	MiscConsts.h
Maximum number of TRADE rows to return for Frame 1	TradeLookupFrame1MaxRows	20	MiscConsts.h

Maximum number of TRADE rows to return for Frame 2	TradeLookupFrame2MaxRows	20	MiscConsts.h
Maximum number of TRADE rows to return for Frame 3	TradeLookupFrame3MaxRows	20	MiscConsts.h
Maximum number of TRADE_HISTORY rows to return	TradeLookupMaxTradeHistoryRowsReturned	3	MiscConsts.h
Trade-Status			
Maximum number of trade status rows to return	max_trade_status_len	50	TxnHarnessStructs.h
Trade-Update			
Maximum number of TRADE rows to return for Transaction	TradeUpdateMaxRows	20	MiscConsts.h
Maximum number of TRADE rows to return for Frame 1	TradeUpdateFrame1MaxRows	20	MiscConsts.h
Maximum number of TRADE rows to return for Frame 2	TradeUpdateFrame2MaxRows	20	MiscConsts.h
Maximum number of TRADE rows to return for Frame 3	TradeUpdateFrame3MaxRows	20	MiscConsts.h
Maximum number of TRADE_HISTORY rows to return	TradeUpdateMaxTradeHistoryRowsReturned	3	MiscConsts.h

3.2.1.3 All data exchanges between **Frames** must be done by the **EGenTxnHarness** through its use of input and output parameters passed in and out of the **Frames**.

Comment 1: The intent of this clause is to prevent the **Frames** from using global variables, or other means, for storing and retrieving information across multiple invocations of the same or different **Frames** in order to avoid work intended to be done during each individual invocation.

Comment 2: The **Test Sponsor** may augment each **Frame** with code to unpack the input parameters received from the **EGenTxnHarness** and to pack the output parameters returned to the **EGenTxnHarness**.

3.2.1.4 The **Frame Implementation** must perform each database interaction specified in the **Transaction's Database Footprint**, using the specified access method.

3.2.1.5 The **Frame Implementation** must access any column that is marked as **Reference**. It is also free to access other columns that are not marked as **Reference**. For the other database interactions, the **Frame Implementation** must perform all the required operations and/or return all the specified column values.

3.2.1.6 The implementation of each **Frame** must be functionally equivalent to the **Pseudo-code** provided for that **Frame** in Clause 3.3. Functional equivalence is satisfied when:

- For a given set of inputs the implementation produces the same outputs and causes the same change in database state as the **Pseudo-code**. A change in database state is a change to a TPC-E Table or TPC-E Table column, resulting from any **Modify**, **Add** or **Remove** access method defined by the **Transaction's Database Footprint**.
- All access methods in the **Database Footprint** are performed.
- No additional **Add/Modify/Remove** access methods against any TPC-E Table are performed.

Comment: Additional **Reference** access methods against any TPC-E Table may be performed. Additional access methods against any **User-Defined Object** may be performed.

- 3.2.1.7 The minimum decimal precision for any computation performed as part of the **Frame** must be the maximum decimal precision of all the individual items in that calculation.
- 3.2.1.8 Each **Frame** and **Transaction** has a status output parameter used to indicate the execution status of the **Frame** or **Transaction**. A status value of 0 indicates success. A negative status value indicates an error that would invalidate a **Test Run**. A positive non-zero integer value for status indicates a warning. Warnings mean that an unexpected result was generated and the **Test Sponsor** and **Auditor** should investigate the unexpected result. The unexpected result may be due to a rare but legal condition or it may be because of an incorrect implementation or run-time problem. If the latter is the cause of the warning, it must be treated as an error that invalidates the **Test Run**.

The following table shows the positive warning numbers and where they may happen in **EGen**.

Transaction	Frame	Warning Status	Reason for Warning
Trade-Lookup	2	+621	num_found == 0
Trade-Lookup	3	+631	num_found == 0
Trade-Lookup	4	+643	num_trades_found == 0
Trade-Update	2	+1021	num_updated == 0
Trade-Update	3	+1031	num_found == 0

- 3.2.1.9 If a transaction processing monitor (hereinafter referred to as TM) is used it must be commercially available software which provides the following features/functionality:

Operation - The TM must allow for:

- request/service prioritization
- multiplexing/de multiplexing of requests/services
- automatic load balancing
- reception, queuing, and execution of multiple requests/services concurrently

Security - The TM must allow for:

- the ability to validate and authorize execution of each service at the time the service is requested.
- the restriction of administrative functions to authorized users.

Administration/Maintenance - The TM must have the predefined capability to perform centralized, non programmatic (i.e., must be implemented in the standard product and not require programming) and dynamic configuration management of TM resources including hardware, network, services (single or group), queue management prioritization rules, etc.

Recovery - The TM must have the capability to:

- post error codes to an application
- detect and terminate long-running transactions based on predefined time-out intervals

Application Transparency - The message context(s) that exist between the client and server application programs must be managed solely by the TM. The client and server application programs must not have any knowledge of the message context or the underlying communication mechanisms that support that context.

Comment 1: The following are examples of implementations that are non-compliant with the Application Transparency requirement.

1. Client and server application programs use the same identifier (e.g., handle or pointer) to maintain the message context for multiple transactions.
2. Change and/or recompilation of the client and/or server application programs is required when the number of queues or equivalent data structures used by the TM to maintain the message context between the client and server application programs is changed by TM administration.

Comment 2: The intent of this clause is to encourage the use of general purpose, commercially available transaction monitors, and to exclude special purpose software developed for benchmarking or other limited use. It is recognized that implementations of features and functionality described above vary across vendors' architectures. Such differences do not preclude compliance with the requirements of this clause.

3.2.2 Customer Partitioning and Generating Transaction Inputs

3.2.2.1 If customer partitioning is being used and the **Frame** is **Customer Initiated**, EGenDriverCE will apply the following rules whenever generating a customer identifier, account identifier or customer tax identifier:

- 50% of the time the data is selected from the partition's range of customers.
- 50% of the time the data is selected from the entire range of customers.

If customer partitioning is not being used, or the **Frame** is not **Customer Initiated**, EGenDriverCE will generate customer identifiers, account identifiers and customer tax identifiers from the entire range of customers.

3.3 The Transactions

The TPC-E benchmark consists of eleven **Transactions**, and one cleanup **Transaction**. To generate a reasonably balanced workload that resembles real production environments, the **Transactions** have to cover a wide variety of system functions. Ten of the **Transactions** follow a specific mix to generate the desired workload while keeping the benchmark environment simple, repeatable and easy to execute. The eleventh **Transaction** is not part of the **Transaction Mix**, but is executed at fixed intervals. This **Transaction**, called "Data-Maintenance", simulates administrative updates to tables that are not otherwise modified by the **Transactions** in the mix. A cleanup **Transaction**, called "Trade-Cleanup", is provided to clean up pending and submitted trades that may exist from an earlier run.

One of the key performance characteristics of database systems is the ratio of reads and writes generated by the workload. To emulate such a ratio, TPC-E has defined **Transactions** with read-only characteristics as well as **Transactions** with read-write characteristics. In addition, the **Transactions** apply varying loads on the processor.

The variety of processor, IO, and execution frequency requirements for the **Transactions** allows the benchmark to emulate a real environment with heavy processor utilization while maintaining a reasonable IO load in a simple benchmark configuration.

The **Transactions** in the mix can be grouped into three categories:

- **Customer Initiated:** These **Transactions** simulate customer interactions with the system and are initiated by the **Customer Emulator** component of the benchmark **Driver**.
- **Brokerage Initiated:** These **Transactions** simulate broker interactions with the system and are initiated by the **Customer Emulator** component of the benchmark **Driver**.

- **Market Triggered:** These **Transactions** simulate the behavior of the market and are triggered by the **Market Exchange Emulator** component of the benchmark **Driver**.

In addition to the mix of **transactions** above, the benchmark defines a time triggered Data-Maintenance **transaction**, which is initiated at fixed time intervals as defined in Clause 6.3.3. Also defined is a Trade-Cleanup **transaction** (see clause 6.3.4), which may not be executed within a **Test Run**, but must be executed once before a **Test Run** if the database is not in its initially populated state (i.e., if any prior runs have been performed on the database).

The following summary table lists the basic characteristics of the **transactions**:

Transaction	Weight	Access	Category	Frames	Definition
Broker-Volume	Mid to Heavy	Read-only	Brokerage Initiated	1	Clause 3.3.1
Customer-Position	Mid to Heavy	Read-only	Customer Initiated	3	Clause 3.3.2
Market-Feed	Medium	Read-write	Market Triggered	1	Clause 3.3.3
Market-Watch	Medium	Read-only	Customer Initiated	1	Clause 3.3.4
Security-Detail	Medium	Read-only	Customer Initiated	1	Clause 3.3.5
Trade-Lookup	Medium	Read-only	Brokerage Initiated for Frames 1 & 3 Customer Initiated for Frames 2 & 4	4	Clause 3.3.6
Trade-Order	Heavy	Read-write	Customer Initiated	6	Clause 3.3.7
Trade-Result	Heavy	Read-write	Market Triggered	6	Clause 3.3.8
Trade-Status	Light	Read-only	Customer Initiated	1	Clause 3.3.9
Trade-Update	Medium	Read-write	Brokerage Initiated for Frames 1& 3 Customer Initiated for Frame 2	3	Clause 3.3.10
Data-Maintenance	Light	Read-write	Time Triggered	1	Clause 3.3.11
Trade-Cleanup	Medium	Read-write	Run once before Test Run	1	Clause 3.3.12

3.3.1 The Broker-Volume Transaction

The Broker-Volume **Transaction** is designed to emulate a brokerage house's "up-to-the-minute" internal business processing. An example of a Broker-Volume **Transaction** would be a manager generating a report on the current performance potential of various brokers.

Broker-Volume is invoked by **EGenDriverCE**. It consists of a single **Frame**. The **Transaction** searches the pending limit orders to find orders that are associated with a given list of brokers responsible for stocks of a given sector. The value of each order is calculated based upon bid price and quantity of shares and added to the running total volume for the appropriate broker. The list of brokers with their associated total volume sorted in descending volume order is returned.

3.3.1.1 Broker-Volume Transaction Parameters

The inputs to the Broker-Volume **Transaction** are generated by the **EGenDriverCE** code in CETxnInputGenerator.cpp and the data structures defined in TxnHarnessStructs.h must be used to communicate the input and output parameters.

Broker-Volume Interfaces	Module/Data Structure
CE Input generation	GenerateBrokerVolumeInput()
Transaction Input/Output Structure	TBrokerVolumeTxnInput

	TBrokerVolumeTxnOutput
Frame 1 Input/Output Structure	TBrokerVolumeTxnInput TBrokerVolumeFrame1Output

Broker-Volume Transaction Parameters:

Parameter	Direction	Description
broker_list[]	IN	A list of twenty to forty distinct broker name strings as defined by B_NAME in BROKER table. Names are randomly selected from the broker range, with, uniform distribution. The list size is determined by the first null input name in the broker_list array.
sector_name	IN	A randomly selected sector name string as defined in SC_NAME in SECTOR table using uniform distribution.
list_len	OUT	Number of items in the list being returned.
status	OUT	Code indicating the execution status for this transaction.
volume[]	OUT	A list of numbers, sorted in descending order, representing the sum of all trade request values (TR_QTY * TR_BID_PRICE) in the TRADE_REQUEST table for stocks in a given sector grouped by broker names provided by broker_list. The list size is determined by list_len parameter.

3.3.1.2 Broker-Volume Transaction Database Footprint

This **Transaction** is read-only and makes no changes to the database. The Broker-Volume **Database Footprint** is as follows:

Broker-Volume Database Footprint		
Table	Column	Frame
		1
BROKER	B_NAME	Return
TRADE_REQUEST	TR_BID_PRICE	Reference
	TR_QTY	Reference
Transaction Control		Start Commit

3.3.1.3 Broker Volume Transaction Frame 1 of 1

The database access methods used in **Frame 1** are all **Returns**.

The **EGenTxnHarness** controls the execution of **Frame 1** as follows:

```
{
    invoke (Broker-Volume_Frame-1)

    if (list_len < 0) or (list_len > max_broker_list_len) then
    {
        status = -111
    }
}
```

Broker-Volume Frame 1 of 1 Parameters:

Parameter	Direction	Description
broker_list[]	IN	A list of twenty to forty distinct broker name strings as defined by B_NAME in BROKER table. Names are randomly selected from the broker range, with uniform distribution. The list size is determined by the first null input name in the broker_list array.
sector_name	IN	A randomly selected sector name string as defined in SC_NAME in SECTOR table using uniform distribution.
broker_name[]	OUT	A list of broker name strings sorted in descending order of the "volume" associated with the broker. The list size is determined by list_len parameter.
list_len	OUT	Number of items in the list being returned.
volume[]	OUT	A list of numbers, sorted in descending order, representing the sum of all trade request values (TR_QTY * TR_BID_PRICE) in the TRADE_REQUEST table for stocks in a given sector grouped by broker names provided by broker_list. The list size is determined by list_len parameter.

Broker-Volume Frame-1 Pseudo-code: Broker Volume

```
{
    start transaction
    // Should return 0 to 40 rows
    select
        broker_name[] = B_NAME,
        volume[]      = sum(TR_QTY * TR_BID_PRICE)
    from
        TRADE_REQUEST,
        SECTOR,
        INDUSTRY,
        COMPANY,
        BROKER,
        SECURITY
    where
        TR_B_ID = B_ID and
        TR_S_SYMB = S_SYMB and
        S_CO_ID = CO_ID and
        CO_IN_ID = IN_ID and
        SC_ID = IN_SC_ID and
        B_NAME in (broker_list) and
        SC_NAME = sector_name
    group by
        B_NAME
    order by
        2 DESC
```

Broker-Volume_Frame-1 Pseudo-code: Broker Volume

```
// row_count will frequently be zero near the start of a Test Run when
// TRADE_REQUEST table is mostly empty.
list_len = row_count
commit transaction

}
```

3.3.2 The Customer-Position Transaction

The Customer-Position **Transaction** is designed to emulate the process of retrieving the customer's profile and summarizing their overall standing based on current market values for all assets. This is representative of the work performed when a customer asks the question "What am I worth today?"

Customer-Position is invoked by **EGenDriverCE**. It consists of three **Frames**, (**Frame 2** and **3** are mutually exclusive). The customer is specified either by a customer ID or a customer tax ID. If the customer ID passed into the **Transaction** is 0, then the customer tax ID is used to look up the customer ID. Detailed information about the customer's profile is retrieved. In addition, for each of the customer's accounts, the cash balance of the account and the total current market value of all holdings in the account are returned.

If a history of trading activity has been requested, information is retrieved on the ten most recent trades for a randomly chosen account among the customer's accounts.

3.3.2.1 Customer-Position Transaction Parameters

The inputs to the Customer Position **Transaction** are generated by the **EGenDriverCE** code in CETxnInputGenerator.cpp and the data structures defined in TxnHarnessStructs.h must be used to communicate the input and output parameters.

Customer-Position Interfaces	Module/Data Structure
CE Input generation	GenerateCustomerPositionInput()
Transaction Input/Output Structure	TCustomerPositionTxnInput TCustomerPositionTxnOutput
Frame 1 Input/Output Structure	TCustomerPositionFrame1Input TCustomerPositionFrame1Output
Frame 2 Input/Output Structure	TCustomerPositionFrame2Input TCustomerPositionFrame2Output
Frame 3 Input/Output Structure	TCustomerPositionFrame3Output

Customer-Position Transaction Parameters:

Parameter	Direction	Description
acct_id_idx	IN	Index to one of the customer's accounts. This indexed account will be used in frame 2 if get_history is TRUE.
cust_id	IN	Customer id or 0, selected by the driver.
get_history	IN	Selected by the driver to be 1 if Frame 2 is to be invoked or 0 if not.
tax_id	IN	Customer tax id or empty string selected by the driver.

acct_id[max_acct_len]	OUT	Array of customer account IDs.
acct_len	OUT	Number of customer accounts (max_acct_len (10) or less)
asset_total[max_acct_len]	OUT	Array of asset totals for each customer account.
c_ad_id	OUT	Customer address identifier.
c_area_1	OUT	Area code for customer's first phone number.
c_area_2	OUT	Area code for customer's second phone number.
c_area_3	OUT	Area code for customer's third phone number.
c_ctry_1	OUT	Country code for customer's first phone number.
c_ctry_2	OUT	Country code for customer's second phone number.
c_ctry_3	OUT	Country code for customer's third phone number.
c_dob	OUT	Customer date of birth.
c_email_1	OUT	Customer's first email address.
c_email_2	OUT	Customer's second email address.
c_ext_1	OUT	Customer's extension for the first phone number.
c_ext_2	OUT	Customer's extension for the second phone number.
c_ext_3	OUT	Customer's extension for the third phone number.
c_f_name	OUT	Customer first name.
c_gndr	OUT	Customer gender.
c_l_name	OUT	Customer last name.
c_local_1	OUT	Customer's first phone number.
c_local_2	OUT	Customer's second phone number.
c_local_3	OUT	Customer's third phone number.
c_m_name	OUT	Customer middle name.
c_st_id	OUT	Customer Status id.
c_tier	OUT	Customer tier.
cash_bal[max_acct_len]	OUT	Array of cash balances for each customer account.
hist_dts[max_hist_len]	OUT	Date for each transaction date from the transaction history
hist_len	OUT	Number of records from the transaction history
qty[max_hist_len]	OUT	Number of shares involved in each event from history
status	OUT	Code indicating the execution status for this transaction.
symbol[max_hist_len]	OUT	Security involved in each event from history.
trade_id[max_hist_len]	OUT	Trade ID for each event from history.
trade_status[max_hist_len]	OUT	Trade Status for each event from history.

3.3.2.2 Customer-Position Transaction Database Footprint

The Customer-Position Database Footprint is as follows:

Customer-Position Database Footprint

Table Name	Column	Frame		
		1	2*	3*
CUSTOMER	C_AD_ID	Return		
	C_AREA_1	Return		
	C_AREA_2	Return		
	C_AREA_3	Return		
	C_CTRY_1	Return		
	C_CTRY_2	Return		
	C_CTRY_3	Return		
	C_DOB	Return		
	C_EMAIL_1	Return		
	C_EMAIL_2	Return		
	C_EXT_1	Return		
	C_EXT_2	Return		
	C_EXT_3	Return		
	C_F_NAME	Return		
	C_GNDR	Return		
	C_L_NAME	Return		
	C_LOCAL_1	Return		
	C_LOCAL_2	Return		
	C_LOCAL_3	Return		
	C_M_NAME	Return		
	C_ST_ID	Return		
	C_TIER	Return		
CUSTOMER_ACCOUNT	CA_BAL	Return		
	CA_ID	Return		
HOLDING_SUMMARY	HS_QTY	Reference		
LAST_TRADE	LT_PRICE	Reference		
STATUS_TYPE	ST_NAME		Return	
TRADE_HISTORY	TH_DTS		Return	
TRADE	T_ID		Return	
	T_QTY		Return	
	T_S_SYMB		Return	
Transaction Control		Start	Commit	Commit

3.3.2.3 Customer-Position Transaction Frame 1 of 3

If the cust_id input parameter is set to 0, the **Frame** must use the tax_id input parameter to search the CUSTOMER table and find the ID of the customer. The **Frame** retrieves the detailed customer information and finds the cash balance for each of the customer's accounts as well as the total value of the holdings in each account. In addition to the detailed customer information, the **Frame** returns a list of accounts and their associated cash balance and asset value sorted by asset value.

The database access methods used in **Frame 1** are **Reference** and **Return**.

The **EGenTxnHarness** controls the execution of **Frame 1** as follows:

```
{
    invoke (Customer-Position_Frame-1)

    if (acct_len < 1) or (acct_len > max_acct_len) then
    {
        status = -211
    }
}
```

Customer-Position Frame 1 of 3 Parameters:

Parameter	Direction	Description
cust_id	IN/OUT	Customer id or 0, selected by the driver. When cust_id is not 0, the rules for determining the range of available customer identifiers are described in clause 3.2.2.1.
tax_id	IN	Customer tax id or empty string selected by the driver. When tax_id is not the empty string, the rules for determining the range of available customer tax identifiers are described in clause 3.2.2.1.
acct_id[max_acct_len]	OUT	Array of customer account IDs.
acct_len	OUT	Number of customer accounts (max_acct_len (10) or less).
asset_total[max_acct_len]	OUT	Array of asset totals for each customer account.
c_ad_id	OUT	Customer address identifier.
c_area_1	OUT	Area code for customer's first phone number.
c_area_2	OUT	Area code for customer's second phone number.
c_area_3	OUT	Area code for customer's third phone number.
c_ctry_1	OUT	Country code for customer's first phone number.
c_ctry_2	OUT	Country code for customer's second phone number.
c_ctry_3	OUT	Country code for customer's third phone number.
c_dob	OUT	Customer date of birth.
c_email_1	OUT	Customer's first email address.
c_email_2	OUT	Customer's second email address.
c_ext_1	OUT	Customer's extension for the first phone number.
c_ext_2	OUT	Customer's extension for the second phone number.
c_ext_3	OUT	Customer's extension for the third phone number.
c_f_name	OUT	Customer first name.
c_gndr	OUT	Customer gender.

c_l_name	OUT	Customer last name.
c_local_1	OUT	Customer's first phone number.
c_local_2	OUT	Customer's second phone number.
c_local_3	OUT	Customer's third phone number.
c_m_name	OUT	Customer middle name.
c_st_id	OUT	Customer Status id.
c_tier	OUT	Customer tier.
cash_bal[max_acct_len]	OUT	Array of cash balances for each customer account.

Customer-Position_Frame-1 Pseudo-code: Get the customer's total assets

```
{
    start transaction
    if (cust_id == null_cust_id) then {
        select
            cust_id = C_ID
        from
            CUSTOMER
        where
            C_TAX_ID = tax_id
    }

    select
        c_st_id    = C_ST_ID,
        c_l_name   = C_L_NAME,
        c_f_name   = C_F_NAME,
        c_m_name   = C_M_NAME,
        c_gndr     = C_GNDR,
        c_tier     = C_TIER,
        c_dob      = C_DOB,
        c_ad_id    = C_AD_ID,
        c_ctry_1   = C_CTRY_1,
        c_area_1   = C_AREA_1,
        c_local_1  = C_LOCAL_1,
        c_ext_1    = C_EXT_1,
        c_ctry_2   = C_CTRY_2,
        c_area_2   = C_AREA_2,
        c_local_2  = C_LOCAL_2,
        c_ext_2    = C_EXT_2,
        c_ctry_3   = C_CTRY_3,
        c_area_3   = C_AREA_3,
        c_local_3  = C_LOCAL_3,
        c_ext_3    = C_EXT_3,
        c_email_1  = C_EMAIL_1,
```

Customer-Position_Frame-1 Pseudo-code: Get the customer's total assets

```
c_email_2 = C_EMAIL_2
from
  CUSTOMER
where
  C_ID = cust_id

// Should return 1 to max_acct_len (10).
select first max_acct_len rows
  acct_id[]      = CA_ID,
  cash_bal[]     = CA_BAL,
  assets_total[] = ifnull((sum(HS_QTY * LT_PRICE)),0)
from
  CUSTOMER_ACCOUNT left outer join
    HOLDING_SUMMARY on HS_CA_ID = CA_ID,
    LAST_TRADE
  where
    CA_C_ID    = cust_id and
    LT_S_SYMB = HS_S_SYMB
group by
  CA_ID, CA_BAL
order by
  3 asc

acct_len = row_count
}
```

3.3.2.4 Customer-Position Transaction Frame 2 of 3

This **Frame** is only executed if the **Transaction** parameter get_history value is set to TRUE. Using the customer account ID the **Frame** must search the TRADE and TRADE_HISTORY tables to find up to 30 history rows that correspond with the 10 most recent trades executed by the customer account. For each event the **Frame** must return the T_ID, T_S_SYMB, T_QTY, TH_DTS, and ST_NAME for all events in a descending order of date found in TH_DTS. This **Frame** completes the work and commits the **Transaction**.

The database access methods used in **Frame 2** are all **Returns**.

The **EGenTxnHarness** controls the execution of **Frame 2** as follows:

```

{
    if (get_history == 1) then
    {
        frame2.acct_id = frame1.acct_id[acct_id_idx]

        invoke (Customer-Position_Frame-2)

        if (hist_len < 10) or (hist_len > max_hist_len) then
        {
            status = -221
        }
        exit
    }
}

```

Customer-Position Frame 2 of 3 Parameters:

Parameter	Direction	Description
acct_id	IN	Customer account identifier
hist_dts[max_hist_len]	OUT	Date for each transaction date from the transaction history
hist_len	OUT	Number of records from the transaction history, at most max_hist_len which is 30.
qty[max_hist_len]	OUT	Number of shares involved in each event from history
symbol[max_hist_len]	OUT	Security involved in each event from history.
trade_id[max_hist_len]	OUT	Trade ID for each event from history.
trade_status[max_hist_len]	OUT	Trade Status for each event from history.

Customer-Position_Frame-2 Pseudo-code: Get the customer's trade history

```

{
    // Should return 10 to 30 rows.
    select first 30 rows
        trade_id[]      = T_ID,
        symbol[]       = T_S_SYMB,
        qty[]          = T_QTY,
        trade_status[] = ST_NAME,
        hist_dts[]     = TH_DTS
    from
        (select first 10 rows
            T_ID as ID
        from
            TRADE

```

Customer-Position_Frame-2 Pseudo-code: Get the customer's trade history

```
    where
        T_CA_ID = acct_id
        order by T_DTS desc) as T,
    TRADE,
    TRADE_HISTORY,
    STATUS_TYPE
  where
    T_ID = ID and
    TH_T_ID = T_ID and
    ST_ID = TH_ST_ID
  order by
    TH_DTS desc

  hist_len = row_count

  commit transaction
}

}
```

3.3.2.5 Customer-Position Transaction Frame 3 of 3

This **Frame** is only executed if **get_history Transaction** input parameter is set to FALSE. The **Frame** simply **Commits** the **Transaction** started in **Frame 1** and returns the status.

There are no database access methods used in **Frame 3**. This **Frame** is only using **Transaction** control operations.

The **EGenTxnHarness** controls the execution of **Frame 3** as follows:

```
{
  if (get_history != 1) then
  {
    invoke (Customer-Position_Frame-3)
  }

}Customer-Position_Frame-3: End database transaction

{
  commit transaction
}
```

3.3.3 The Market-Feed Transaction

The Market-Feed **Transaction** is designed to emulate the process of tracking the current market activity. This is representative of the brokerage house processing the “ticker-tape” from the market exchange.

Market-Feed is invoked by **EGenDriverMEE**. It consists of a single **Frame**. The **Transaction** receives the latest trade activity information (symbol, price, quantity, etc.) from the market exchange. As a result of processing the ticker feed, the prices for securities will increase or decrease. These changes in price may trigger pending limit orders. If triggered, limit order processing is performed by sending details of the trade request to the MEE, via the `SendToMarketFromFrame` interface.

Each Market-Feed ticker consists of 20 entries (`max_feed_len` constant in `TxnHarnessStructs.h`). Ten of these entries are a result of trades submitted to the MEE by this brokerage house. The remaining entries are generated by the MEE to simulate the reporting of trades from other brokerage houses. The Market-Feed **Transaction** is allowed to process any number of ticker elements (from one to all) per **Database Transaction**.

3.3.3.1 Market-Feed Transaction Parameters

The inputs to the Market-Feed **Transaction** are generated by the **EGenDriverMEE** code in `MEE.cpp`. The data structures defined in `TxnHarnessStructs.h` must be used to communicate the input and output parameters.

Market-Feed Interfaces	Module/Data Structure
MEE Input generation	<code>CMEESUTInterface::MarketFeed()</code>
Transaction Input/Output Structure	<code>TMarketFeedTxnInput</code> <code>TMarketFeedTxnOutput</code>
Frame 1 Input/Output Structure	<code>TMarketFeedFrame1Input</code> <code>TMarketFeedFrame1Output</code>

Market-Feed Transaction Parameters:

Parameter	Direction	Description
<code>price_quote[]</code>	IN	A list of numeric prices the Market Exchange Emulator generated for each entry on the ticker list. Each security's price fluctuates between a low and high price, the fluctuation has a predefined frequency.
<code>status_submitted</code>	IN	The string ID value for the <code>STATUS_TYPESubmitted</code> status.
<code>symbol[]</code>	IN	A list of strings containing the Security Symbol for each security on the ticker. The security symbol string follows the definition of <code>LT_S_SYMB</code> in the <code>LAST_TRADE</code> table. The ticker was generated by the Market Exchange Emulator.
<code>trade_qty[]</code>	IN	A list of numbers representing the number of shares of a security that were traded for this ticker entry. The <code>trade_qty</code> is the same as the <code>trade_qty</code> requested in the Trade Request.
<code>type_limit_buy</code>	IN	The string ID value for the <code>TRADE_TYPELimit-Buy</code> type.
<code>type_limit_sell</code>	IN	The string ID value for the <code>TRADE_TYPELimit-Sell</code> type.
<code>type_stop_loss</code>	IN	The string ID value for the <code>TRADE_TYPEStop-Loss</code> type.
<code>unique_symbols</code>	IN	The number of unique security symbols in the ticker stream.
<code>send_len</code>	OUT	Length of the output array. Ranges from 0 upwards. Average is about 4.
<code>status</code>	OUT	Code indicating the execution status for this transaction.

3.3.3.2 Market-Feed Transaction Database Footprint

The Market-Feed **Database Footprint** is as follows:

Market-Feed Database Footprint		
Table Name	Column	Frame

		1
LAST_TRADE	LT_DTS	Modify
	LT_PRICE	Modify
	LT_VOL	Reference Modify
TRADE	T_DTS	Modify*
	T_ST_ID	Modify*
TRADE_HISTORY	1 Row	Add*
TRADE_REQUEST	TR_BID_PRICE	Return
	TR_QTY	Return
	TR_T_ID	Return
	TR_TT_ID	Return
	Row(s)	Remove*
Transaction Control		Start Commit (1 - max_feed_len)

3.3.3.3 Market-Feed Transaction Frame 1 of 1

Using the entries in the ticker list, the **Frame** is responsible for:

- modifying the rows in the LAST_TRADE table with the new prices, the new daily volumes and the new last trade dates
- identifying any pending limit orders that should be triggered by these ticker prices, processing them, and submitting them to the MEE

The database access methods used in **Frame 1** are **Modifies**, **Adds**, **References**, **Removes** and **Returns**.

The EGenTxnHarness controls the execution of **Frame 1** as follows:

```
{
    invoke (Market-Feed_Frame-1)
    if (num_updated < unique_symbols) then
    {
        status = -311;
    }
}
```

Market-Feed Frame 1 of 1 Parameters:

Parameter	Direction	Description
price_quote[]	IN	A list of numeric prices the Market Exchange Emulator generated for each entry on the ticker list. Each security's price fluctuates between a low and high price, the fluctuation has a predefined frequency.
status_submitted	IN	The string ID value for the STATUS_TYPESubmitted status.
symbol[]	IN	A list of strings containing the Security Symbol for each security on the ticker. The security symbol string follows the definition of LT_S_SYMB in the LAST_TRADE table. The ticker was generated by the Market

		Exchange Emulator.
trade_qty[]	IN	A list of numbers representing the number of shares of a security that were traded for this ticker entry. The trade_qty is the same as the trade_qty requested in the Trade Request.
type_limit_buy	IN	The string ID value for the TRADE_TYPE Limit-Buy type.
type_limit_sell	IN	The string ID value for the TRADE_TYPE Limit-Sell type.
type_stop_loss	IN	The string ID value for the TRADE_TYPE Stop-Loss type.
num_updated	OUT	Number of LAST_TRADE rows updated.
send_len	OUT	Length of the output arrays. Ranges from 0 upwards. Average is about 4.

Market-Feed Frame-1 Pseudo-code: Record the stock price and process any pending limit orders which are triggered by the ticker price.

```
{
    declare now_dts DATETIME
    declare TradeRequestBuffer[]
    declare req_price_quote S_PRICE_T
    declare req_trade_id TRADE_T
    declare req_trade_qty S_QTY_T
    declare req_trade_type CHAR(3)
    declare rows_updated int
    declare rows_sent int

    get_current_dts(now_dts)
    rows_updated = 0

    for (i = 1, i<=max_feed_len, i++) {
        start transaction

        rows_sent = 0

        update
            LAST_TRADE
        set
            LT_PRICE = price_quote[i],
            LT_VOL = LT_VOL + trade_qty[i],
            LT_DTS = now_dts
        where
            LT_S_SYMBOL = symbol[i]

        rows_updated = rows_updated + row_count

}
} /* end of ticker loop */

}
```

3.3.4 The Market-Watch Transaction

The **Market-Watch Transaction** is designed to emulate the process of monitoring the overall performance of the market by allowing a customer to track the current daily trend (up or down) of a collection of securities. The collection of securities being monitored may be based upon a customer's current holdings, a customer's watch list of prospective securities, or a particular industry.

Market-Watch is invoked by **EGenDriverCE**. It consists of a single **Frame**. This **Transaction** calculates the percentage change in value of the market capitalization of a collection of securities at a chosen day's closing prices compared to the current market prices. The chosen day is non-uniformly selected from the 1305 days of market data that was loaded during initial population of the database. The calculation is done by looking at the chosen day's closing price for each security in the list and multiplying that by the number of outstanding shares for that security. This product is added to a running total for the chosen day's closing market capitalization. In addition, the current price for each security in the list is multiplied by the number of outstanding shares for that security. This product is added to a running sum for the current market capitalization. The difference between the total market capitalization for the chosen day's closing and the current total, expressed as a percentage, is returned.

The **Transaction** supports this market watch calculation on a group of securities chosen based on the following list of criteria:

- **Prospective-Watch** - The collection of securities is chosen using all the securities in a customer's watch list. The rules for determining the range of available customers, and thereby watch lists, are described in clause 3.2.2.1.
- **Industry-Watch** - The collection of securities is chosen using all the securities in an industry belonging to companies within a specified range. The industry name is chosen at random from the possible industry names using a uniform distribution.
- **Portfolio-Watch** - The collection of securities is chosen using all the securities that are held in a customer's account. The rules for determining the range of available customers are described in clause 3.3.1.1. The customer account identifier is chosen at random from all the possible accounts for that customer using a uniform distribution.

3.3.4.1 Market-Watch Transaction Parameters

The inputs to the Market-Watch **Transaction** are generated by the **EGenDriverCE** code in CETxnInputGenerator.cpp. The data structures defined in TxnHarnessStructs.h must be used to communicate the input and output parameters.

Market-Watch Interfaces	Module/Data Structure
CE Input generation	GenerateMarketWatchInput()
Transaction Input/Output Structure	TMarketWatchTxnInput TMarketWatchTxnOutput
Frame 1 Input/Output Structure	TMarketWatchFrame1Input TMarketWatchFrame1Output

Market-Watch Transaction Parameters:

Parameter	Direction	Description
acct_id	IN	A single customer is chosen non-uniformly by customer tier, from the range of available customers. The rules for determining the range of available customers are described in clause 3.2.2.1. A single customer account id, as defined by CA_ID in CUSTOMER_ACCOUNT, is chosen at random, uniformly, from the range of customer account ids for the chosen customer. This input will be used 35% of the time. The securities collection will be all the securities held this customer account. The other 65% of the time when this input is not being used its value will be 0.
cust_id	IN	A number randomly selected from the possible customer identifiers as defined by C_ID in CUSTOMER table using a non-uniform by customer tier distribution. (The rules for determining the range of possible customer identifiers are described in clause 3.2.2.1.) This input will be used 60% of the time. The securities collection will be all the securities in this customer's watch list. The other 40% of the time when this input is not being used its value will be 0.
ending_co_id	IN	Company identifier of the last company in the range of 5,000 companies

		to be searched for companies in IN_NAME industry. The value will be starting_co_id + 4,999. This input will only be used when industry_name is used which is 5% of the time. The other 95% of the time when this input is not being used its value will be zero.
industry_name	IN	A randomly selected industry name string as defined in IN_NAME in INDUSTRY table using uniform distribution. This input will be used 5% of the time. The securities collection will be all the securities of companies in this industry. The other 95% of the time when this input is not being used its value will be an empty string.
start_date	IN	A date non-uniformly selected from the 1305 days in the DAILY_MARKET table. The closing price of securities on this date is used in the market capitalization calculations.
starting_co_id	IN	A number randomly selected from the range of possible company identifiers minus 4,999. Company identifier of the first company in the range of 5,000 companies to be searched for companies in IN_NAME industry. This input will only be used when industry_name is used which is 5% of the time. The other 95% of the time when this input is not being used its value will be zero.
pct_change	OUT	Numeric value calculated during the transaction by finding the percentage change from chosen day's close of business capitalization for the collection of securities and the current capitalization for the collection of securities.
status	OUT	Code indicating the execution status for this transaction.

3.3.4.2 Market-Watch Transaction Database Footprint

The Market-Watch Database Footprint is as follows:

Market-Watch Database Footprint		
Table	Column	Frame
		1
COMPANY	CO_ID	Reference*
	CO_IN_ID	Reference*
DAILY_MARKET	DM_CLOSE	Reference
HOLDING_SUMMARY	HS_S_SYMB	Reference*
INDUSTRY	IN_ID	Reference*
	IN_NAME	Reference*
LAST_TRADE	LT_PRICE	Reference
SECURITY	S_CO_ID	Reference*
	S_NUM_OUT	Reference
	S_SYMB	Reference*

WATCH_LIST	WL_C_ID	Reference*
	WL_ID	Reference*
Transaction Control		Start Commit

3.3.4.3 Market-Watch Transaction Frame 1 of 1

The database access methods used in **Frame 1** are all **References**.

The **EGenTxnHarness** controls the execution of **Frame 1** as follows:

```

{
    if (acct_id != 0) or (cust_id != 0) or (industry_name != "") then
    {
        invoke (Market-Watch_Frame-1)
    }
    else
    {
        status = -411
    }
}

```

Market-Watch Frame 1 of 1 Parameters:

Parameter	Direction	Description
acct_id	IN	A single customer is chosen non-uniformly by customer tier, from the range of available customers. The rules for determining the range of available customers are described in clause 3.2.2.1. A single customer account id, as defined by CA_ID in CUSTOMER_ACCOUNT, is chosen at random, uniformly, from the range of customer account ids for the chosen customer. This input will be used 35% of the time. The securities collection will be all the securities held this customer account. The other 65% of the time when this input is not being used its value will be 0.
cust_id	IN	A number randomly selected from the possible customer identifiers as defined by C_ID in CUSTOMER table using a non-uniform by customer tier distribution. (The rules for determining the range of possible customer identifiers are described in clause 3.2.2.1.) This input will be used 60% of the time. The securities collection will be all the securities in this customer's watch list. The other 40% of the time when this input is not being used its value will be 0.
ending_co_id	IN	Company identifier of the last company in the range of 5,000 companies to be searched for companies in IN_NAME industry. The value will be starting_co_id + 4,999. This input will only be used when industry_name is used which is 5% of the time. The other 95% of the time when this input is not being used its value will be zero.
industry_name	IN	A randomly selected industry name string as defined in IN_NAME in INDUSTRY table using uniform distribution. This input will be used 5% of the time. The securities collection will be all the securities of companies in this industry. The other 95% of the time when this input is not being used its value will be an empty string.
start_date	IN	A date non-uniformly selected from the 1305 days in the DAILY_MARKET table. The closing price of securities on this date is used in the market capitalization calculations
starting_co_id	IN	A number randomly selected from the range of possible company identifiers minus 4,999. Company identifier of the first company in the range of 5,000 companies to be searched for companies in IN_NAME industry. This input will only be used when industry_name is used which is 5% of the time. The other 95% of the time when this input is not being used its value will be zero.
pct_change	OUT	Numeric value calculated during the transaction by finding the percentage change from chosen day's close of business capitalization for the collection of securities and the current capitalization for the collection of securities.

```

3.3.5 The Security-Detail Transaction

The **Security-Detail Transaction** is designed to emulate the process of accessing detailed information on a particular security. This is representative of a customer doing research on a security prior to making a decision about whether or not to execute a trade.

Security-Detail is invoked by **EGenDriverCE**. It consists of a single **Frame**. For a given security, the **Transaction** will return detailed security and company information, a list of the company's competitors, current and historical financial data, and recent news items about the company.

3.3.5.1 Security-Detail Transaction Parameters

The inputs to the Security-Detail **Transaction** are generated by the **EGenDriverCE** code in CETxnInputGenerator.cpp and the data structures defined in TxnHarnessStructs.h must be used to communicate the input and output parameters.

Security-Detail Interfaces	Module/Data Structure
CE Input generation	GenerateSecurityDetailInput()
Transaction Input/Output Structure	TSecurityDetailTxnInput TSecurityDetailTxnOutput
Frame 1 Input/Output Structure	TSecurityDetailFrame1Input TSecurityDetailFrame1Output

Security-Detail Transaction Parameters:

Parameter	Direction	Description
access_lob_flag	IN	If 1, access the complete news articles for the company. If 0, access just the news headlines and summaries.
max_rows_to_return	IN	An integer value, randomly selected between 5 and 20 with a uniform distribution. This value determines how many rows must be returned from the DAILY_MARKET table for this security.
start_day	IN	A date randomly selected from a uniform distribution of dates between 3 January 2000 and max_rows_to_return days before 1 January 2005. The DAILY_MARKET table contains data for the period 3 January 2000 to 31 December 2004. The transaction will return max_rows_to_return worth of rows from the DAILY_MARKET table for this security beginning with the row for start_day.
symbol	IN	Security symbol, randomly selected from a uniform distribution.
last_vol	OUT	Volume of last trade
news_len	OUT	Number of news items returned in news array.
status	OUT	Code indicating the execution status for this transaction.

3.3.5.2 Security-Detail Transaction Database Footprint

3.3.5.3 Security Detail Transaction Frame 1 of 1

The database access methods used in **Frame 1** are **Returns** and **References**.

The **EGenTxnHarness** controls the execution of **Frame 1** as follows:

```
{
    invoke (Security-Detail_Frame-1)
    if (day_len < min_day_len) or (day_len > max_day_len) then
    {
        status = -511
    }
    else if (fin_len != max_fin_len) then
    {
        status = -512
    }
    else if (news_len != max_news_len) then
    {
        status = -513
    }
}
```

Security-Detail Frame 1 of 1 Parameters:

Parameter	Direction	Description
access_lob_flag	IN	If 1, access the complete news articles for the company. If 0, access just the news headlines and summaries.
max_rows_to_return	IN	An integer value, randomly selected between 5 (iSecurityDetailMinRows) and 20 (iSecurityDetailMaxRows) with a

		uniform distribution. This value determines how many rows must be returned from the DAILY_MARKET table for this security.
start_day	IN	A date randomly selected from a uniform distribution of dates between 3 January 2000 and max_rows_to_return before 31 December 2004. The DAILY_MARKET table contains data for the period 3 January 2000 to 31 December 2004. The transaction will return max_rows_to_return worth of rows from the DAILY_MARKET table for this security beginning with the row for start_day.
symbol	IN	Security symbol, randomly selected from a uniform distribution.
52_wk_high	OUT	Number showing 52 week high value for the security.
52_wk_high_date	OUT	Date showing when the 52_wk_high happened.
52_wk_low	OUT	Number showing 52 week low value for the security.
52_wk_low_date	OUT	Date showing when 52_wk_low happened.
ceo_name	OUT	CEO name, based on a list of distinct first and last names.
co_ad_ctry	OUT	Company country, USA or Canada
co_ad_div	OUT	Company county or state or province
co_ad_line1	OUT	Line 1 from a real company address
co_ad_line2	OUT	Line 2 from a real company address
co_ad_town	OUT	Company town
co_ad_zip	OUT	Company ZIP or postal code. Contains partly realistic US or Canadian ZIP codes
co_desc	OUT	Short description of the company. Readable English text.
co_name	OUT	Company name
co_st_id	OUT	Contains the value 'ST1'
cp_co_name[max_comp_len]	OUT	Array of strings containing the company names of competitors for this securities' company. EGen loads the COMPANY_COMPETITOR table with 3 competitors for each company, so max_comp_len is 3.
cp_in_name[max_comp_len]	OUT	Array of strings containing the name of the industries in which competitors compete with this securities' company. EGen loads the COMPANY_COMPETITOR table with 3 competitors for each company, so max_comp_len is 3.
day[max_day_len]	OUT	Array of numbers containing daily data. max_day_len is a constant set to 20.
day_len	OUT	Elements in the Day array
divid	OUT	Number containing security dividend
ex_ad_ctry	OUT	Exchange country
ex_ad_div	OUT	Exchange county or town or province
ex_ad_line1	OUT	Line 1 from real exchange address
ex_ad_line2	OUT	Line 2 from real exchange address
ex_ad_town	OUT	Exchange town
ex_ad_zip	OUT	Exchange ZIP code
ex_close	OUT	Time the exchange closes, 2 possible values.
ex_date	OUT	Date listed on exchange. Not earlier than Start_date
ex_desc	OUT	Description of the exchange
ex_name	OUT	Name of the exchange. 4 values
ex_num_symb	OUT	Number of securities traded

ex_open	OUT	Time the exchange opens
fin[max_fin_len]	OUT	Array of numbers with financial data. max_fin_len (20) is a constant set in the EGen code.
fin_len	OUT	Length of the array
last_open	OUT	Price of security at last exchange open
last_price	OUT	Price for security
last_vol	OUT	Volume of last trade
news[max_news_len]	OUT	Array of news items about the security's company. max_new_len (2) is a constant set in the EGen code.
news_len	OUT	Number of news items returned in news array.
num_out	OUT	Number of outstanding shares. Valid range is 4,000,000 to 9,500,000,000.
open_date	OUT	Date the company opened. Valid range is 01/01/1800 to build date
pe_ratio	OUT	Price/earning ratio. A random value between 1.00 and 120.00
s_name	OUT	Security name, 6850 distinct values
sp_rate	OUT	Standards & Poor rating for the company, one of 39 values.
start_date	OUT	Date of trade started. Range id between 01/01/1900 and build date.
yield	OUT	Number containing yield for the security

3.3.6 The Trade-Lookup Transaction

The **Trade-Lookup Transaction** is designed to emulate information retrieval by either a customer or a broker to satisfy their questions regarding a set of trades. The various sets of trades are chosen such that the work is representative of:

- performing general market analysis

- reviewing trades for a period of time prior to the most recent account statement
- analyzing past performance of a particular security
- analyzing the history of a particular customer holding

Trade-Lookup is invoked by **EGenDriverCE**. It consists of four mutually exclusive **Frames**. Each **Frame** employs a different technique for looking up historical trade data.

Frame 1 accepts a list of trade IDs. Information for each of the trades in the list is returned.

Frame 2 accepts a customer account ID, a start timestamp, end timestamp and a number of trades (N) as inputs. It returns information for the first N trades for the specified customer account between the start and end timestamps (inclusive).

Frame 3 accepts a security symbol, a start timestamp, end timestamp and a number of trades (N) as inputs. It returns information for the first N trades for the given security between the start and end timestamps (inclusive).

Frame 4 accepts a customer account ID and a timestamp as inputs. The first trade for this customer account at or after the specified timestamp is identified. Then a maximum of 20 historical holding changes for this trade ID are returned. The historical holding changes report on changes made by this trade to holdings created by prior trades, and report on changes made by subsequent trades to any holding created by this trade.

3.3.6.1 Trade-Lookup Transaction Parameters

The inputs to the Trade-Lookup **Transaction** are generated by the **EGenDriverCE** code in **CETxnInputGenerator.cpp**. The data structures defined in **TxnHarnessStructs.h** must be used to communicate the input and output parameters.

Trade-Lookup Interfaces	Module/Data Structure
CE Input generation	GenerateTradeLookupInput()
Transaction Input/Output Structure	TTradeLookupTxnInput TTradeLookupTxnOutput
Frame1 Input/Output Structure	TTradeLookupFrame1Input TTradeLookupFrame1Output
Frame2 Input/Output Structure	TTradeLookupFrame2Input TTradeLookupFrame2Output
Frame3 Input/Output Structure	TTradeLookupFrame3Input TTradeLookupFrame3Output
Frame4 Input/Output Structure	TTradeLookupFrame4Input TTradeLookupFrame4Output

Trade-Lookup Transaction Parameters:

Parameter	Direction	Description
acct_id	IN	Customer account ID. Used when frame_to_execute is 2 or 4, otherwise set to 0.
end_trade_dts	IN	For Frames 1 and 4, this parameter is ignored, so it is set to an empty date. Used in Frame 2 as the end point in time for identifying a particular trade. Used in Frame 3 as the end point in time for identifying trades for a particular symbol.
frame_to_execute	IN	Identifies which of the mutually exclusive frames to execute.
max_acct_id	IN	Used in Frame 3 to identify the maximum customer account ID, otherwise set to 0.
max_trades	IN	Used in Frames 1, 2 and 3 for the number of trades to find otherwise set to 0.

		The default value for max_trades for each frame is set in the TTradeLookupSettings structure in DriverParameterSettings.h
start_trade_dts	IN	For Frame 1, this parameter is ignored, so it is set to an empty date. Used in Frame 2 as the point in time for identifying a particular trade. Non-uniform over pre-populated interval. Used in Frame 3 as the point in time for identifying trades for a particular symbol. Uniform over pre-populated interval. Used in Frame 4 as the point in time for identifying a particular trade. Uniform over pre-populated interval.
symbol	IN	Used in Frame 3 as the security symbol for which to find trades. Uniformly chosen over all securities. For the other frames symbol is set to the empty string.
trade_id[]	IN	Array of non-uniform randomly chosen trade IDs used by Frame 1 to identify a set of particular trades. For the other frames array elements are set to 0. For Frame 1, max_trades indicates how many elements are to be used in the array.
frame_executed	OUT	Confirmation of which frame was executed.
is_cash[]	OUT	Indicates whether the trades used in Frame 1, 2 or 3 were cash transactions.
is_market[]	OUT	Indicates whether the trades used in Frame 1 were market order trades.
num_found	OUT	Number of trade rows found for frames 1, 2, 3, or number of holding history rows found for frame 4.
status	OUT	Code indicating the execution status for this transaction.
trade_list[]	OUT	List of trade IDs found in Frames 2 and 3.

3.3.6.2 Trade-Lookup Transaction Database Footprint

The Trade-Lookup Database Footprint is as follows:

Trade-Lookup Database Footprint					
Table	Column	Frame			
		1*	2*	3*	4*
CASH_TRANSACTION	CT_AMT	Return*	Return*	Return*	
	CT_DTS	Return*	Return*	Return*	
	CT_NAME	Return*	Return*	Return*	
HOLDING_HISTORY	Row(s)				Return*
SETTLEMENT	SE_AMT	Return	Return	Return	
	SE_CASH_DUE_DATE	Return	Return	Return	
	SE_CASH_TYPE	Return	Return	Return	
TRADE	T_BID_PRICE	Return	Return		
	T_CA_ID			Return	
	T_DTS		Reference	Return	Reference
	T_EXEC_NAME	Return	Return	Return	
	T_ID		Return	Return	Return
	T_IS_CASH	Return	Return	Return	
	T_QTY			Return	
	T_S_SYMB			Reference	
	T_TRADE_PRICE	Return	Return	Return	

	T_TT_ID			Return	
TRADE_HISTORY	TH_DTS	Return	Return	Return	
	TH_ST_ID	Return	Return	Return	
TRADE_TYPE	TT_IS_MRKT	Return			
Transaction Control	Start Commit				

3.3.6.3 Trade-Lookup Transaction Frame 1 of 4

The first **Frame** is responsible for retrieving information about the specified array of trade IDs.

The **EGenTxnHarness** controls the execution of **Frame 1** as follows:

```
{
    if( frame_to_execute == 1 )
    {
        invoke (Trade-Lookup_Frame-1)
        if (num_found != max_trades) then
        {
            status = -611
        }
        frame_executed = 1
    }
    [...]
}
```

Trade-Lookup Frame 1 of 4 Parameters:

Parameter	Direction	Description
max_trades	IN	Number of valid array elements in trade_id[]. The default value (20) is set in TTradeLookupSettings.MaxRowsFrame1 in DriverParameterSettings.h.
trade_id[]	IN	The array of trade IDs picked non-uniformly over the set of pre-populated trades.
bid_price[]	OUT	The requested unit price.
cash_transaction_amount[]	OUT	Amount of the cash transaction.
cash_transaction_dts[]	OUT	Date and time stamp of when the transaction took place.
cash_transaction_name[]	OUT	Description of the cash transaction.
exec_name[]	OUT	Name of the person who executed the trade.
is_cash[]	OUT	Flag that is non-zero for a cash trade, zero for a margin trade.
is_market[]	OUT	Flag that is non-zero for a market trade, zero for a limit trade.
num_found	OUT	Number of trade rows returned; should be the same as max_trades.
settlement_amount[]	OUT	Cash amount of settlement.
settlement_cash_due_date[]	OUT	Date by which customer or brokerage must receive the cash.
settlement_cash_type[]	OUT	Type of cash settlement involved: cash or margin.
trade_history_dts[][3]	OUT	Array of timestamps of when the trade history was updated.

trade_history_status_id[][3]	OUT	Array of status type identifiers.
trade_price[]	OUT	Unit price at which the security was traded.

Trade-Lookup_Frame-1 Pseudo-code: Get trade information for each trade ID in the trade_id array

```
{
    declare i int
    start transaction

    num_found = 0

    for (i = 0; i++; i < max_trades) do {
        // Get trade information
        // Should only return one row for each trade
        select
            bid_price[i]      = T_BID_PRICE,
            exec_name[i]     = T_EXEC_NAME,
            is_cash[i]       = T_IS_CASH,
            is_market[i]     = TT_IS_MRKT,
            trade_price[i]   = T_TRADE_PRICE
        from
            TRADE,
            TRADE_TYPE
        where
            T_ID = trade_id[i] and
            T_TT_ID = TT_ID

        num_found = num_found + row_count

        // Get settlement information
        // Should only return one row for each trade
        select
            settlement_amount[i]      = SE_AMT,
            settlement_cash_due_date[i] = SE_CASH_DUE_DATE,
            settlement_cash_type[i]    = SE_CASH_TYPE
        from
            SETTLEMENT
        where
            SE_T_ID = trade_id[i]

        // get cash information if this is a cash transaction
        // Should only return one row for each trade that was a cash transaction
        if (is_cash[i]) then {
            select
                cash_transaction_amount[i] = CT_AMT,
```

Trade-Lookup_Frame-1 Pseudo-code: Get trade information for each trade ID in the trade_id array

```
cash_transaction_dts[i]      = CT_DTS,
cash_transaction_name[i]     = CT_NAME
from
  CASH_TRANSACTION
where
  CT_T_ID = trade_id[i]
}

// read trade_history for the trades
// Should return 2 to 3 rows per trade
select first 3 rows
  trade_history_dts[i][]      = TH_DTS,
  trade_history_status_id[i][] = TH_ST_ID
from
  TRADE_HISTORY
where
  TH_T_ID = trade_id[i]
order by
  TH_DTS
} // end for loop

commit transaction
}
```

3.3.6.4 Trade-Lookup Transaction Frame 2 of 4

The second **Frame** returns information for the first N trades executed for the specified customer account between a specified start time and end time. If the specified start time is too close to the specified end time, then it is possible that fewer than N trades may be returned.

The **EGenTxnHarness** controls the execution of **Frame 2** as follows:

```

[...]
    else if( frame_to_execute == 2 )
    {
        invoke (Trade-Lookup_Frame-2)

        if (num_found < 0) or (num_found > max_trades) then
        {

            status = -621
        }

        else if (num_found == 0) then
        {

            // Can happen rarely in large databases when an account has no trades
            // in the last 4 days
            status = +621
        }
    }

    frame_executed = 2
}
[...]

```

Trade-Lookup Frame 2 of 4 Parameters:

Parameter	Direction	Description
acct_id	IN	A single customer is chosen non-uniformly by customer tier, from the range of available customers. The rules for determining the range of available customers are described in clause 3.2.2.1. A single customer account id, as defined by CA_ID in CUSTOMER_ACCOUNT, is chosen at random, uniformly, from the range of customer account ids for the chosen customer.
end_trade_dts	IN	Point in time at which to stop searching for N trades.
max_trades	IN	Maximum number of trades to return. The default value (20) is set in TTradeLookupSettings.MaxRowsFrame2 in DriverParameterSettings.h.
start_trade_dts	IN	Point in time from which to search for N trades.
bid_price[]	OUT	The requested unit price.
cash_transaction_amount[]	OUT	Amount of the cash transaction.
cash_transaction_dts[]	OUT	Date and time stamp of when the transaction took place.
cash_transaction_name[]	OUT	Description of the cash transaction.
exec_name[]	OUT	Name of the person who executed the trade.
is_cash[]	OUT	Flag that is non-zero for a cash trade, zero for a margin trade.
num_found	OUT	Number of trade rows returned (may be less than max_trades).
settlement_amount[]	OUT	Cash amount of settlement.
settlement_cash_due_date[]	OUT	Date by which customer or brokerage must receive the cash.
settlement_cash_type[]	OUT	Type of cash settlement involved: cash or margin.
trade_history_dts[][3]	OUT	Array of timestamps of when the trade history was updated.
trade_history_status_id[][3]	OUT	Array of status type identifiers.
trade_list[]	OUT	Trade ID actually used for retrieving data.

trade_price[]	OUT	Unit price at which the security was traded.
----------------	-----	--

Trade-Lookup_Frame-2 Pseudo-code : Get trade information for the first N trades of a given customer account from a given point in time.

```
{
    declare i int
    start transaction

    // Get trade information
    // Should return between 0 and max_trades rows
    select first max_trades rows
        bid_price[]      = T_BID_PRICE,
        exec_name[]     = T_EXEC_NAME,
        is_cash[]       = T_IS_CASH,
        trade_list[]    = T_ID,
        trade_price[]   = T_TRADE_PRICE
    from
        TRADE
    where
        T_CA_ID = acct_id and
        T_DTS >= start_trade_dts and
        T_DTS <= end_trade_dts
    order by
        T_DTS asc

    num_found = row_count

    // Get extra information for each trade in the trade list.
    for (i = 0; i < num_found; i++) {
        // Get settlement information
        // Should return only one row for each trade
        select
            settlement_amount[i]      = SE_AMT,
            settlement_cash_due_date[i] = SE_CASH_DUE_DATE,
            settlement_cash_type[i]    = SE_CASH_TYPE
        from
            SETTLEMENT
        where
            SE_T_ID = trade_list[i]

        // get cash information if this is a cash transaction
        // Should return only one row for each trade that was a cash transaction
        if (is_cash[i]) then {
            select
                cash_transaction_amount[i] = CT_AMT,
```

Trade-Lookup_Frame-2 Pseudo-code : Get trade information for the first N trades of a given customer account from a given point in time.

```
cash_transaction_dts[i]      = CT_DTS
cash_transaction_name[i]     = CT_NAME
from
CASH_TRANSACTION
where
CT_T_ID = trade_list[i]
}

// read trade_history for the trades
// Should return 2 to 3 rows per trade
select first 3 rows
trade_history_dts[i][]       = TH_DTS,
trade_history_status_id[i][] = TH_ST_ID
from
TRADE_HISTORY
where
TH_T_ID = trade_list[i]
order by
TH_DTS

} // end for loop

commit transaction
}
```

3.3.6.5 Trade-Lookup Transaction Frame 3 of 4

The third **Frame** returns information for the first N trades for a given security between a specified start time and end time. If the specified start time is too close to the specified end time, then it is possible that fewer than N trades may be returned.

The **EGenTxnHarness** controls the execution of **Frame 3** as follows:

```

[...]
    else if( frame_to_execute == 3 )
    {
        invoke (Trade-Lookup_Frame-3)
        if (num_found < 0) or (num_found > max_trades) then
        {
            status = -631
        }
        else if (num_found == 0) then
        {
            // Can happen rarely in large databases
            status = +631
        }
        frame_executed = 3
    }
}

```

Trade-Lookup Frame 3 of 4 Parameters:

Parameter	Direction	Description
end_trade_dts	IN	Point in time at which to end the search.
max_acct_id	IN	Maximum customer account ID.
max_trades	IN	Maximum number of trades to find. The default value (20) is set in TTradeLookupSettings.MaxRowsFrame3 in DriverParameterSettings.h.
start_trade_dts	IN	Point in time from which to start search.
symbol	IN	Security for which to find trades.
acct_id[]	OUT	Array of accounts for which the trades were done.
cash_transaction_amount[]	OUT	Amount of the cash transaction.
cash_transaction_dts[]	OUT	Date and time stamp of when the transaction took place.
cash_transaction_name[]	OUT	Description of the cash transaction.
exec_name[]	OUT	Array of name of the person who executed each of the trades.
is_cash[]	OUT	Flag that is non-zero for a cash trade, zero for a margin trade.
num_found	OUT	Number of TRADE rows returned.
price[]	OUT	Array of the price that was paid in each trade.
quantity[]	OUT	Array of the quantity of security bought in each trade.
settlement_amount[]	OUT	Cash amount of settlement.
settlement_cash_due_date[]	OUT	Date by which the customer or brokerage must receive the cash.
settlement_cash_type[]	OUT	Type of cash settlement involved: cash or margin.
trade_dts[]	OUT	Array of the timestamps for when the trade was requested.
trade_history_dts[][3]	OUT	Array of timestamps of when the trade history was updated.
trade_history_status_id[][3]	OUT	Array of status type identifiers.
trade_list[]	OUT	Array of T_IDs found.

trade_type[]	OUT	Array of the trade type for each trade.
--------------	-----	---

Trade-Lookup_Frame-3 Pseudo-code: Get a list of N trades executed for a certain security starting from a given point in time.

```
{
    declare i int
    start transaction

    // Should return between 0 and max_trades rows.
    select first max_trades rows
        acct_id[]      = T_CA_ID,

        // Should return only one row for each trade
        select
            settlement_amount[i]      = SE_AMT,
            settlement_cash_due_date[i] = SE_CASH_DUE_DATE,
            settlement_cash_type[i]    = SE_CASH_TYPE
        from
            SETTLEMENT
        where
            SE_T_ID = trade_list[i]
```

Trade-Lookup_Frame-3 Pseudo-code: Get a list of N trades executed for a certain security starting from a given point in time.

```
// get cash information if this is a cash transaction
// Should return only one row for each trade that was a cash transaction
if (is_cash[i]) then {
    select
        cash_transaction_amount[i] = CT_AMT,
        cash_transaction_dts[i]     = CT_DTS
        cash_transaction_name[i]   = CT_NAME
    from
        CASH_TRANSACTION
    where
        CT_T_ID = trade_list[i]
}

// read trade_history for the trades
// Should return 2 to 3 rows per trade
select first 3 rows
    trade_history_dts[i][]      = TH_DTS,
    trade_history_status_id[i][] = TH_ST_ID
from
    TRADE_HISTORY
where
    TH_T_ID = trade_list[i]
order by
    TH_DTS asc

} // end for loop

commit transaction
}
```

3.3.6.6 Trade-Lookup Transaction Frame 4 of 4

The fourth **Frame** identifies the first trade for the specified customer account on or after the specified time. Up to the first 20 rows in the HOLDING_HISTORY with a matching trade ID are then returned. If the specified time is too close to the end of the historical trade data, it is possible that no matching trade may be found for the specified customer account.

The **EGenTxnHarness** controls the execution of **Frame 4** as follows:

```

[...]
else if( frame_to_execute == 4 )
{
    invoke (Trade-Lookup_Frame-4)

    if (num_trades_found <> 1) then
    {
        status = -641
    }

    if (num_found == 0) then
    {
        status = +643
    }

    if (num_found < 0) or (num_found > 20) then
    {
        status = -642
    }

    frame_executed = 4
}
[...]

```

Trade-Lookup Frame 4 of 4 Parameters:

Parameter	Direction	Description
acct_id	IN	A single customer is chosen non-uniformly by customer tier, from the range of available customers. The rules for determining the range of available customers are described in clause 3.2.2.1. A single customer account id, as defined by CA_ID in CUSTOMER_ACCOUNT, is chosen at random, uniformly, from the range of customer account ids for the chosen customer.
start_trade_dts	IN	Point in time from which to search for a trade.
holding_history_id[20]	OUT	Array of trade identifiers of the trades that originally created each of the returned holding rows.
holding_history_trade_id[20]	OUT	Array of trade identifiers of the trades that modified each of the returned holding rows.
num_found	OUT	Number of HOLDING_HISTORY rows returned (may be zero).
num_trades_found	OUT	Number of TRADE rows found.
quantity_after[20]	OUT	Array of quantities of the security that was held after the holding was modified.
quantity_before[20]	OUT	Array of quantities of the security that was held before the holding was modified.

trade_id	OUT	ID of first trade found for customer account at or after the specified time. This is the ID that is used for the look up in HOLDING_HISTORY.
----------	-----	--

Trade-Lookup_Frame-4 Pseudo-code: Return HOLDING_HISTORY information for a particular trade ID.

```
{
    start transaction

    select first 1 row
        trade_id = T_ID
    from
        TRADE
    where
        T_CA_ID = acct_id and
        T_DTS >= start_trade_dts
    order by
        T_DTS asc

    num_trades_found = row_count
    // The trade_id is used in the subquery to find the original trade_id
    // (HH_H_T_ID), which then is used to list all the entries.

    // Should return 0 to (capped) 20 rows.
    select first 20 rows
        holding_history_id[]      = HH_H_T_ID,
        holding_history_trade_id[] = HH_T_ID,
        quantity_before[]          = HH_BEFORE_QTY,
        quantity_after[]            = HH_AFTER_QTY
    from
        HOLDING_HISTORY
    where
        HH_H_T_ID in
        (select
            HH_H_T_ID
        from
            HOLDING_HISTORY
        where
            HH_T_ID = trade_id)

    num_found = row_count

    commit transaction
}
```

Trade-Lookup_Frame-4 Pseudo-code: Return HOLDING_HISTORY information for a particular trade ID.

3.3.7 The Trade-Order Transaction

The Trade Order **Transaction** is designed to emulate the process of buying or selling a security by a Customer, Broker, or authorized third-party. If the person executing the trade order is not the account owner, the **Transaction** will verify that the person has the appropriate authorization to perform the trade order. The **Transaction** allows the person trading to execute buys at the current market price, sells at the current market price, or limit buys and sells at a requested price. The **Transaction** also provides an estimate of the financial impact of the proposed trade by providing profit/loss data, tax implications, and anticipated commission fees. This allows the trader to evaluate the desirability of the proposed security trade before either submitting or canceling the trade.

The Trade-Order **Transaction** is invoked by **EGenDriverCE**. It consists of six **Frames**. The **Transaction** starts by using the account ID passed into the **Transaction** to obtain information on the customer, the customer's account, and the broker for the account.

Next, the **Transaction** conditionally validates that the person executing the trade is authorized to perform such actions on the specified account. If the executor is not authorized, then the **Transaction** rolls back. However, during the benchmark execution, the **CE** will always generate authorized executors.

The next step is to estimate the overall financial implications of executing the trade. For limit-orders, the requested price is used in the estimation; for market orders, the requested price is set to the current market value of the security and that value is used in the estimation. Estimation includes assessing any effects the requested trade would have on existing holdings (e.g. the sale of existing long positions, or the cover of existing short positions). If a profit would be realized as a result of this trade, the capital gains taxes are calculated. Administrative fees and the broker's commission for handling the trade are calculated. If the trade is being submitted on margin, the customer's total assets for the account are assessed. All the above information is used for recording the order.

After all the above processing has completed, a small percentage of the Trade-Order **Transactions** are selected to emulate either the canceling the order or an error condition by rolling back all modifications. All other Trade-Order **Transactions** are **Committed**. After a successfully **Committed** market order, the **EGenTxnHarness** sends the order for the trade to the appropriate **MEE**.

3.3.7.1 Trade-Order Transaction Parameters

The inputs to the Trade-Order **Transaction** are generated by the **EGenDriverCE** code in **CETxnInputGenerator.cpp**. The data structures defined in **TxnHarnessStructs.h** must be used to communicate the input and output parameters.

Trade-Order Interfaces	Module/Data Structure
CE Input generation	GenerateTradeOrderInput()
Transaction Input/Output Structure	TTTradeOrderTxnInput TTTradeOrderTxnOutput
Frame 1 Input/Output Structure	TTTradeOrderFrame1Input TTTradeOrderFrame1Output
Frame 2 Input/Output Structure	TTTradeOrderFrame2Input TTTradeOrderFrame2Output

Frame 3 Input/Output Structure	TTradeOrderFrame3Input TTradeOrderFrame3Output
Frame 4 Input/Output Structure	TTradeOrderFrame4Input TTradeOrderFrame4Output
Frame 5 Input/Output Structure	TTradeOrderFrame5Output
Frame 6 Input/Output Structure	TTradeOrderFrame6Output

Trade-Order Transaction Parameters:

Parameter	Direction	Description
acct_id	IN	A single customer is chosen non-uniformly by customer tier, from the range of available customers. The rules for determining the range of available customers are described in clause 3.2.2.1. A single customer account id, as defined by CA_ID in CUSTOMER_ACCOUNT, is chosen at random, uniformly, from the range of customer account ids for the chosen customer.
co_name	IN	The security being traded in this transaction can be specified in one of two ways. Either by specifying the security's symbol, or by specifying the company name and the issue. If the symbol is used to specify the security, then the company name and the issue are an empty string (i.e. ""). Otherwise the company name and the issue are both specified and the symbol is an empty string (i.e. ""). For more information, see Clause 6.4.1.
exec_f_name	IN	First name of the person executing the trade. Note that the person executing this trade, may not be the registered owner of the account. If this is the case, the executor's permission to execute trades for this account will be verified in Frame 2. For more information, see Clause 6.4.1.
exec_l_name	IN	Last name of the person executing the trade. Note that the person executing this trade, may not be the registered owner of the account. If this is the case, the executor's permission to execute trades for this account will be verified in Frame 2. For more information, see Clause 6.4.1.
exec_tax_id	IN	Tax identifier for the person executing the trade. Note that the person executing this trade, may not be the registered owner of the account. If this is the case, the executor's permission to execute trades for this account will be verified in Frame 2. For more information, see Clause 6.4.1.
is_lifo	IN	If this flag is set to 1 then this trade will process against existing holdings from newest to oldest (LIFO order). If this flag is set to 0, then this trade will process against existing holdings from oldest to newest (FIFO order).
issue	IN	The security being traded in this transaction can be specified in one of two ways. Either by specifying the security's symbol, or by specifying the company name and the issue. If the symbol is used to specify the security, then the company name and the issue are an empty string (i.e. ""). Otherwise the company name and the issue are both specified and the symbol is an empty string (i.e. ""). For more information, see Clause 6.4.1.
requested_price	IN	For a limit order, this is the requested price for triggering the trade. For a market order, the input value is undefined and this variable is set to the current market price for the given security inside Frame 3.
roll_it_back	IN	If this flag is 1 then an intentional rollback (Frame 5) is executed. If 0, then a commit (Frame 6) is executed. See Clause 6.4.1 for details on the percentage of trades that will be intentionally rolled back.
st_pending_id	IN	Identifier for the "Pending" order status - passed in for ease of benchmarking.
st_submitted_id	IN	Identifier for the "Submitted" order status - passed in for ease of benchmarking.
symbol	IN	The security being traded in this transaction can be specified in one of two ways. Either by specifying the security's symbol, or by specifying the company name and the issue. If the symbol is used to specify the security, then the company name and the issue are an empty string (i.e. ""). Otherwise the company name and the issue are both specified and the symbol is an empty string (i.e. ""). For more information, see Clause 6.4.1.

trade_qty	IN	The number of shares to be traded for this order.
trade_type_id	IN	Identifier indicating the type of trade - passed in for each of benchmarking. For more information on the different types of trades generated, see Clause 6.4.1.
type_is_margin	IN	If this flag is set to 1, then the order will be done on margin. If the flag is set to 0, then this trade will be done with cash.
buy_value	OUT	The total dollar amount for the securities bought for a matching sell order. If trade is a buy or sell of new securities then buy_value is zero.
sell_value	OUT	The total dollar value of the securities sold for a matching buy order. If trade is buy or sell of new securities then sell_value is zero.
status	OUT	Code indicating the execution status for this transaction.
tax_amount	OUT	The estimated amount of tax that will be incurred as a result of this order. If no profit is realized, then tax_amount is zero.
trade_id	OUT	Unique trade identifier generated by the SUT for this order.

3.3.7.2 Trade-Order Transaction Database Footprint

This **Transaction** includes a mixture of Add, Reference, and Return access methods. The Trade-Order **Database Footprint** is as follows:

Trade-Order Database Footprint						
Table	Column	Frame				
		1	2*	3	4	5*
ACCOUNT_PERMISSION	AP_ACL		Return			
	AP_CA_ID		Reference			
	AP_F_NAME		Reference

TRADE_REQUEST	1 Row			Add*			
TRADE_TYPE	TT_IS_MRKT			Return			
	TT_IS_SELL			Return			
Transaction Control		Start				Rollback	Commit

3.3.7.3 Trade-Order Transaction Frame 1 of 6

The first **Frame** is responsible for retrieving information about the customer, customer account, and its broker.

The **EGenTxnHarness** controls the execution of **Frame 1** as follows:

```
{
    invoke (Trade-Order_Frame-1)
    if (num_found <> 1) then
    {
        status = -711
    }
}
```

Trade-Order Frame 1 of 6 Parameters:

Parameter	Direction	Description
acct_id	IN	Identifier of the customer account involved in the transaction.
acct_name	OUT	Name of the account specified by acct_id.
broker_id	OUT	Identifier of the broker associated with the specified acct_id.
broker_name	OUT	Name of the broker associated with the specified acct_id.
cust_f_name	OUT	First name of the customer who owns the specified account. This output string must not contain trailing white space.
cust_id	OUT	Unique identifier of the customer who owns the specified account.
cust_l_name	OUT	Last name of the customer who owns the specified account. This output string must not contain trailing white space.
cust_tier	OUT	The brokerage house service level tier this customer belongs to.
num_found	OUT	Number of CUSTOMER_ACCOUNT rows found.
tax_id	OUT	Tax identifier for the customer who owns the specified account. This output string must not contain trailing white space.

tax_status	OUT	Tax status of the customer who owns the specified account.
------------	-----	--

Trade-Order_Frame-1 Pseudo-code: Get customer, customer account, and broker information

```
{
    start transaction

    // Get account, customer, and broker information
    select
        acct_name = CA_NAME,
        broker_id = CA_B_ID,
        cust_id   = CA_C_ID,
        tax_status = CA_TAX_ST
    from
        CUSTOMER_ACCOUNT
    where
        CA_ID = acct_id

    num_found = row_count

    select
        cust_f_name = C_F_NAME,
        cust_l_name = C_L_NAME,
        cust_tier   = C_TIER,
        tax_id      = C_TAX_ID
    from
        CUSTOMER
    where
        C_ID = cust_id

    select
        broker_name = B_NAME
    from
        BROKER
    where
        B_ID = broker_id
}
```

3.3.7.4 Trade-Order Transaction Frame 2 of 6

The second **Frame** is conditionally executed when the **Transaction** executor's first name, last name, and tax id do not match the customer first name, customer last name, and customer tax id returned in **Frame 1**. **Frame 2** is responsible for validating the executor's permission to order trades for the specified customer account.

The database access methods used in **Frame 2** are all **References**.

```

{
    if (exec_l_name != cust_l_name or
        exec_f_name != cust_f_name or
        exec_tax_id != tax_id) then
    {
        invoke (Trade-Order_Frame-2)
        if (ap_acl[0] == '\0') then
        {
            status = -721;
        }
    }
}

```

Trade-Order Frame 2 of 6 Parameters:

Parameter	Direction	Description
acct_id	IN	Identifier of the customer account involved in the transaction.
exec_f_name	IN	First name of the person executing the trade.
exec_l_name	IN	Last name of the person executing the trade.
exec_tax_id	IN	Tax identifier for the person executing the trade.
ap_acl	OUT	Account permission access control list string for this executor on this customer account. If a NULL string is returned, then the executor of this transaction does not have permission to execute trades for the specified account.

Trade-Order_Frame-2 Pseudo-code : Check executor's permission

```

{
    select
        ap_acl = AP_ACL
    from
        ACCOUNT_PERMISSION
    where
        AP_CA_ID = acct_id and
        AP_F_NAME = exec_f_name and
        AP_L_NAME = exec_l_name and
        AP_TAX_ID = exec_tax_id
}

```

3.3.7.5 Trade-Order Transaction Frame 3 of 6

The third **Frame** is responsible for estimating the overall impact of executing the requested trade. Profit and loss estimates are calculated and capital gains taxes are estimated based on any profits. Administrative fees and commission rates are obtained. If this is a margin trade, the customer's assets needed to cover the cost of the trade are calculated using current market values.

The database access methods used in **Frame 3** are **References** and **Returns**.

The **EGenTxnHarness** controls the execution of **Frame 3** as follows:

```

{
    invoke (Trade-Order_Frame-3)

    if ((sell_value > buy_value) and
        ((tax_status == 1) or (tax_status == 2)) and
        (tax_amount == 0.00)) then

    {
        status = -731
    }

    else if (comm_rate == 0.0000) then
    {
        status = -732
    }

    else if (charge_amount == 0.00) then
    {
        status = -733
    }
}

```

Trade-Order Frame 3 of 6 Parameters:

Parameter	Direction	Description
acct_id	IN	Identifier of the customer account involved in the transaction.
cust_id	IN	The brokerage house service-level (or tier) to which this customer belongs.
cust_tier	IN	The brokerage house service level tier this customer belongs to.
is_lifo	IN	If this flag is set to 1 then this trade will process against existing holdings from newest to oldest (LIFO order). If this flag is set to 0, then this trade will process against existing holdings from oldest to newest (FIFO order).
issue	IN	Specifies the particular issue of security for the given company. This value is an empty string (i.e. "") if the security is specified by symbol.
st_pending_id	IN	Identifier for the "Pending" order status - passed in for ease of benchmarking.
st_submitted_id	IN	Identifier for the "Submitted" order status - passed in for ease of benchmarking.
tax_status	IN	Tax status of the customer who owns the specified account.
trade_qty	IN	The number of shares to be traded for this order.
trade_type_id	IN	Identifier indicating the type of trade - passed in for ease of benchmarking.
type_is_margin	IN	If this flag is set to 1, then the order will be done on margin. If the flag is set to 0, then this trade will be done with cash.
co_name	IN-OUT	Name of the company for the security being traded. Otherwise, if the trade is being done based on symbol, then co_name is an empty string (i.e. "") and will be set appropriately inside the frame. This output string must not contain trailing white space.

requested_price	IN-OUT	For a limit order, this is the requested price for triggering the trade. For a market order, the input value is undefined and this variable must be set to the current market price for the given security.
symbol	IN-OUT	The stock symbol for the security being traded. Otherwise, if the trade is being done based on co_name and issue, then symbol is an empty string (i.e. "") and will be set appropriately inside the frame. This output string must not contain trailing white space.
buy_value	OUT	The total dollar amount for the securities bought for a matching sell order. If trade is a buy or sell of new securities then buy_value is zero.
charge_amount	OUT	The fee charged by the brokerage house for processing this trade.
comm_rate	OUT	The broker's commission rate for processing this trade.
acct_assets	OUT	If this trade is being done on margin, this will be set to the sum of the cash balance and the current market value of all holdings in the specified account.
market_price	OUT	The current market trading price of the security.
s_name	OUT	The full name of the security. This output string must not contain trailing white space.
sell_value	OUT	The total dollar value of the securities sold for a matching buy order. If trade is buy or sell of new securities then sell_value is zero.
status_id	OUT	Identifier indicating the status of this order (either pending or submitted). This output string must not contain trailing white space.
tax_amount	OUT	The estimated amount of tax that will be incurred as a result of this order. If no profit is realized, then tax_amount is zero.
type_is_market	OUT	Flag set to 1 for market orders and to 0 for limit orders.
type_is_sell	OUT	Flag set to 1 for sell orders and to 0 for buy orders.

Trade-Order_Frame-3 Pseudo-code: Estimate overall effects of the trade

```

    from
        HOLDING_SUMMARY,
        LAST_TRADE
    where
        HS_CA_ID = acct_id and
        LT_S_SYMBOL = HS_S_SYMBOL
```

Trade-Order_Frame-3 Pseudo-code: Estimate overall effects of the trade

```
    if (hold_assets is NULL)      /* account currently has no holdings */
        cust_assets = acct_bal
    else
        acct_assets = hold_assets + acct_bal
    }

    // Set the status for this trade
    if (type_is_market then {
        status_id = st_submitted_id
    } else {
        status_id = st_pending_id
    }
}
```

3.3.7.6 Trade-Order Transaction Frame 4 of 6

The fourth **Frame** is responsible for creating an audit trail record of the order and assigning a unique trade ID to it.

The database access methods used in **Frame 4** are all **Adds**.

```
{
    // Estimate the total commision amount for this trade.
    comm_amount = (comm_rate / 100) * trade_qty * requested_price
    exec_name = exec_f_name + " " + exec_l_name
    is_cash = !(type_is_margin)
    invoke (Trade-Order_Frame-4)
}
```

Trade-Order Frame 4 of 6 Parameters:

Parameter	Direction	Description
acct_id	IN	Identifier of the customer account involved in the transaction.
broker_id	IN	Identifier of the broker associated with the customer account involved in the transaction.
charge_amount	IN	The fee charged by the brokerage house for processing this trade.
comm_amount	IN	The broker's commission for processing this trade.
exec_name	IN	First and last name of the person executing this trade.
is_cash	IN	If this flag is set to 1, then this trade will be done with cash. If this flag is set to 0, then this trade will be done on margin.
is_lifo	IN	If this flag is set to 1 then this trade will process against existing holdings from newest to oldest (LIFO order). If this flag is set to 0, then this trade will process against existing holdings from oldest to newest (FIFO order).
requested_price	IN	For a limit trade, this is the requested price for triggering action. For a market order, this has been set by the harness code to the current market price for the given security.

status_id	IN	Identifier indicating the status of this order (either pending or submitted).
symbol	IN	The stock symbol for the security being traded.
trade_qty	IN	The number of shares to be traded for this order.
trade_type_id	IN	Identifier indicating the type of trade to be executed.
type_is_market	IN	Flag set to 1 for market orders and to 0 for limit orders.
trade_id	OUT	Unique trade identifier generated by the SUT for this order.

Trade-Order_Frame-4 Pseudo-code: Record the trade request by making all related updates

```
{
    // Get the timestamp and unique trade ID for this trade.
    Declare now_dts      DATETIME
    get_current_dts ( now_dts )
    get_new_trade_id ( trade_id )

    // Record trade information in TRADE table.

    trade_id,          // TH_T_ID
    now_dts,           // TH_DTS
    status_id          // TH_ST_ID
)
}
```

3.3.7.7 Trade-Order Transaction Frame 5 of 6

The fifth **Frame** is conditionally executed when the parameter `roll_it_back` is set to 1. This **Frame** is responsible for intentionally rolling back all database updates from this **Transaction**, occasionally exercising the rollback functionality.

There are no database access methods used in **Frame 5**. This **Frame** is only using **Transaction** control operations.

The **EGenTxnHarness** controls the execution of **Frame 5** as follows:

```
{
    if (roll_it_back) then {
        invoke (Trade-Order_Frame-5)
        exit // Rest of transaction and SendToMarket are skipped
    }
}
```

Trade-Order_Frame-5 Pseudo-code: Rollback database transaction

```
{  
    // Intentional rollback of transaction caused by driver (CE).  
    rollback transaction  
}
```

3.3.7.8 Trade-Order Transaction Frame 6 of 6

The sixth **Frame** is conditionally executed when parameter roll_it_back is set to 0. This **Frame** is responsible for committing all database updates from this **Transaction**.

There are no database access methods used in **Frame 6**. This **Frame** is only using **Transaction** control operations.

The **EGenTxnHarness** controls the execution of **Frame 6** as follows:

```
{  
    invoke (Trade-Order_Frame-6)  
  
    if (type_is_market) then {  
        eAction = eMEEProcessOrder  
    }  
    else {  
        eAction = eMEESetLimitOrderTrigger  
    }  
  
    // Send the trade to the Market Exchange Emulator (MEE)  
    SendToMarketFromHarness (  
        requested_price,  
        symbol,  
        trade_id,  
        trade_qty,  
        trade_type_id,  
        eAction  
    )  
}
```

Trade-Order Frame 6 Pseudo-code: Commit database transaction

```
{
```

Trade-Order Frame 6 Pseudo-code : Commit database transaction

```
    commit transaction  
}
```

3.3.8 The Trade-Result Transaction

The Trade-Result **Transaction** is designed to emulate the process of completing a stock market trade. This is representative of a brokerage house receiving from the market exchange the final confirmation and price for the trade. The customer's holdings are updated to reflect that the trade has completed. Estimates generated when the trade was ordered for the broker commission and other similar quantities are replaced with the actual numbers and historical information about the trade is recorded for later reference.

Trade-Result is invoked by **EGenDriverMEE**. It consists of six **Frames**. The **Transaction** starts by using the trade ID passed into the **Transaction** to obtain information about the trade. The information gathered includes the account ID of the customer account, which is used to lookup additional account information.

Next the customer's holdings are updated to reflect the completion of the trade. The particular work done depends on the type of trade (buy or sell), the number of shares involved and the customer's current position (long or short) with respect to the security. When selling shares, current holdings are liquidated to cover the sale. If the customer does not have enough shares to cover the sale, any currently held shares are liquidated and a short position is taken for the balance of shares. If the customer already has a short position and more shares are sold, then the short position is simply extended. An analogous situation exists when purchasing shares. Any shares bought will first be used to cover any existing short position. After that, any shares bought will be used to create or extend a long position.

If, when reconciling the trade with the customer's current holdings, any shares are sold for a profit and the profit is taxable, the amount of tax due on the profit is calculated.

Next the broker's commission is calculated and then all information with respect to the trade is recorded.

Finally, settlement records are entered for the trade and if the trade is not on margin, the customer's account balance is update accordingly.

3.3.8.1 Trade-Result Transaction Parameters

The inputs to the Trade-Result **Transaction** are generated by the **EGenDriverMEE** code in MEE.cpp. The data structures defined in TxnHarnessStructs.h must be used to communicate the input and output parameters.

Trade-Result Interfaces	Module/Data Structure
MEE Input generation	CMEESUTInterface::TradeResult()
Transaction Input/Output Structure	TTradeResultTxnInput TTradeResultTxnOutput
Frame 1 Input/Output Structure	TTradeResultFrame1Input TTradeResultFrame1Output
Frame 2 Input/Output Structure	TTradeResultFrame2Input TTradeResultFrame2Output
Frame 3 Input/Output Structure	TTradeResultFrame3Input TTradeResultFrame3Output

Frame 4 Input/Output Structure	TTradeResultFrame4Input TTradeResultFrame4Output
Frame 5 Input/Output Structure	TTradeResultFrame5Input TTradeResultFrame5Output
Frame 6 Input/Output Structure	TTradeResultFrame6Input TTradeResultFrame6Output

Trade-Result Transaction Parameters:

Parameter	Direction	Description
trade_id	IN	The Trade ID for the trade to be settled. Trade ID is the primary key of the TRADE table.
trade_price	IN	The price of the trade.
acct_bal	OUT	Customer account's cash balance after the trade was completed.
acct_id	OUT	Customer account ID of the customer account involved in Trade-Result transaction.
load_unit	OUT	Load Unit number for the customer account involved in the Trade-Result transaction.
status	OUT	Code indicating the execution status for this transaction.

3.3.8.2 Trade-Result Transaction Database Footprint

This **Transaction** includes a mixture of Reference, Return, Modify, Remove and Add operations. The Trade-Result **Database Footprint** is as follows:

Trade-Result Database Footprint						
Table	Column	Frame				
		1	2	3*	4	5
BROKER	B_COMM_TOTAL					Reference Modify
	B_NUM_TRADES					Reference Modify
CASH_TRANSACTION	1 row					Add *

Transaction Control		Start					Commit

3.3.8.3 Trade-Result Transaction Frame 1 of 6

The first **Frame** is responsible for retrieving information about the customer and its trade.

The database access methods used in **Frame 1** are all **Returns**.

The **EGenTxnHarness** controls the execution of **Frame 1** as follows:

```
{
    invoke (Trade-Result_Frame-1)
    if (num_found <> 1) then
    {
        status = -811
    }
}
```

Trade-Result Frame 1 of 6 Parameters:

Parameter	Direction	Description
-----------	-----------	-------------

trade_id	IN	The trade ID for the trade to be settled passed to the transaction by the Market-Exchange-Emulator.
acct_id	OUT	Customer account ID of the customer account involved in Trade-Result transaction.
charge	OUT	Fee charged for placing this trade request.
hs_qty	OUT	Current quantity of shares of the security being traded, that the customer holds in their account.
is_lifo	OUT	If this flag is set to 1, then this trade will process against existing holdings from newest to oldest (LIFO order). If this flag is set to 0, then this trade will process against existing holdings from oldest to newest (FIFO order).
num_found	OUT	Number of TRADE rows found.
symbol	OUT	Seven character identifier of security that is being traded. This output string must not contain trailing white space.
trade_is_cash	OUT	Boolean indicating trade is for cash (1) or on margin (0).
trade_qty	OUT	Quantity of securities traded
type_id	OUT	Trade type identifier, (T_TT_ID). This output string must not contain trailing white space.
type_is_market	OUT	Boolean indicating trade type is a market trade (1) or limit trade (0).
type_is_sell	OUT	Boolean indicating if this is a sell trade (1) or a buy trade (0).
type_name	OUT	Trade type name

Trade-Result_Frame-1 Pseudo-code: Get info on the trade and the customer's account

```
{
    start transaction

    select
        acct_id      = T_CA_ID,
        type_id      = T_TT_ID,
        symbol       = T_S_SYMB,
        trade_qty    = T_QTY,
        charge       = T_CHRG,
        is_lifo      = T_LIFO,
        trade_is_cash = T_IS_CASH
    from
        TRADE
    where
        T_ID = trade_id

    num_found = row_count

    select
        type_name     = TT_NAME,
        type_is_sell  = TT_IS_SELL,
```

Trade-Result_Frame-1 Pseudo-code: Get info on the trade and the customer's account

```
type_is_market = TT_IS_MRKT
from
    TRADE_TYPE
where
    TT_ID = type_id

select
    hs_qty = HS_QTY
from
    HOLDING_SUMMARY
where
    HS_CA_ID = acct_id and
    HS_S_SYMBOL = symbol

if (hs_qty is NULL) then      // no prior holdings exist
    hs_qty = 0
}
```

3.3.8.4 Trade-Result Transaction Frame 2 of 6

The second **Frame** is responsible for modifying the customer's holdings to reflect the result of a buy or a sell trade.

The database access methods used in **Frame 2** are a mixture of **References**, **Modifies**, **Removes** and **Adds**.

The **EGenTxnHarness** controls the execution of **Frame 2** as follows:

```
{
    invoke (Trade-Result_Frame-2)
}
```

Trade-Result Frame 2 of 6 Parameters:

Parameter	Direction	Description
acct_id	IN	Customer account ID of the customer account involved in the Trade-Result transaction obtained in Frame 1
hs_qty	IN	Current quantity of shares of the security being traded, that the customer holds in their account.
is_lifo	IN	If this flag is set to 1, then this trade will process against existing holdings from newest to oldest (LIFO order). If this flag is set to 0, then this trade will process against holdings from oldest to newest (FIFO order).
symbol	IN	Seven character security identifier obtained in Frame 1
trade_id	IN	The trade ID for the trade to be settled passed to the transaction by the Market- Exchange-Emulator. Used for insert(s) into the HOLDING and HOLDING_HISTORY tables.
trade_price	IN	The price of the trade passed to the Trade-Result Transaction by the Market Exchange Emulator.

trade_qty	IN	Quantity of securities traded obtained from Frame 1
type_is_sell	IN	Boolean obtained in Frame 1 indicating if this is a sell trade (1) or a buy trade (0).
broker_id	OUT	ID of the broker who executed the trade.
buy_value	OUT	The total dollar amount for the securities bought for a matching sell order. If trade is a buy or sell of new securities then buy_value is zero.
cust_id	OUT	Customer ID of the customer who owns the customer account involved in the trade.
sell_value	OUT	The total dollar value of the securities sold for a matching buy order. If trade is buy or sell of new securities then sell_value is zero.
tax_status	OUT	Customer account tax status
trade_dts	OUT	Date and time of trade result generated by the SUT.

Trade-Result_Frame-2 Pseudo-code: Update the customer's holdings for buy or sell

```

3.3.8.5 Trade-Result Transaction Frame 3 of 6

The third **Frame** is responsible for computing the amount of tax due by the customer as a result of the trade. **Frame 3** is only executed if the customer is liquidating existing holdings, and the liquidation has resulted in a gain, and the customer's tax status is either 1 or 2. The amount of tax due is recorded in the TRADE table.

Comment: The parameter tax_amount is used by the **EGenTxnHarness** to compute the value of the parameter se_amount just before **Frame 6**. Thus, the parameter tax_amount is initialized to zero and is passed in and out of **Frame 3**.

The database access methods used in **Frame 3** are a mixture of **References** and **Modifies**.

The **EGenTxnHarness** controls the execution of **Frame 3** as follows:

```

{
    tax_amount = 0.00
    if ((tax_status == 1 or tax_status == 2)
        and (sell_value > buy_value)) then
    {
        invoke (Trade-Result_Frame-3)
        if (tax_amount <= 0.00) then
        {
            status = -831
        }
    }
}

```

Trade-Result Frame 3 of 6 Parameters:

Parameter	Direction	Description
buy_value	IN	The total dollar amount for the securities bought for a matching sell order.
cust_id	IN	Customer ID of the customer involved in the Trade-Result transaction, which was obtained in Frame 1.
sell_value	IN	The total dollar value of the securities sold for a matching buy order.
trade_id	IN	The Trade ID for the trade to be settled passed to the transaction by the Market-Exchange-Emulator.
tax_amount	OUT	Tax_amount is initialized to 0.0 by the EGen code and modified by Frame 3.

Trade-Result_Frame-3 Pseudo-code: Compute and record the tax liability

```

{
    // Local Frame variables
    Declare tax_rates      S_PRICE_T
    select
        tax_rates = sum(TX_RATE)
    from
        TAXRATE
    where
        TX_ID in ( select
            CX_TX_ID
        from
            CUSTOMER_TAXRATE
        where
            CX_C_ID = cust_id)

    tax_amount = (sell_value - buy_value) * tax_rates
}

```

Trade-Result_Frame-3 Pseudo-code: Compute and record the tax liability

```
update
    TRADE
set
    T_TAX = tax_amount
where
    T_ID = trade_id
}
```

3.3.8.6 Trade-Result Transaction Frame 4 of 6

The fourth **Frame** is responsible for computing the commission for the broker who executed the trade.

The database access methods used in **Frame 4** are all **References**.

The **EGenTxnHarness** controls the execution of **Frame 4** as follows:

```
{
    invoke (Trade-Result_Frame-4)
    if (comm_rate <= 0.00) then
    {
        status = -841
    }
}
```

Trade-Result Frame 4 of 6 Parameters:

Parameter	Direction	Description
cust_id	IN	Customer ID of the customer involved in the Trade-Result transaction, which was obtained in Frame 1.
symbol	IN	Seven character security identifier, which was obtained in Frame 1
trade_qty	IN	Quantity of securities traded, which was obtained in Frame 1
type_id	IN	Trade type identifier, which was obtained in Frame 1
comm_rate	OUT	The broker commission rate. Ranges from 0.00 to 100.00.
s_name	OUT	Name of security traded

Trade-Result_Frame-4 Pseudo-code: Compute and record the broker's commission

```
{
    select
        s_ex_id = S_EX_ID,
        s_name   = S_NAME
    from
```

Trade-Result_Frame-4 Pseudo-code: Compute and record the broker's commission

```
SECURITY
where
    S_SYMB = symbol

select
    c_tier = C_TIER
from
    CUSTOMER
where
    C_ID = cust_id

// Only want 1 commission rate row
select first 1 row
    comm_rate = CR_RATE
from
    COMMISSION_RATE
where
    CR_C_TIER = c_tier and
    CR_TT_ID = type_id and
    CR_EX_ID = s_ex_id and
    CR_FROM_QTY <= trade_qty and
    CR_TO_QTY >= trade_qty
}
```

3.3.8.7 Trade-Result Transaction Frame 5 of 6

The fifth **Frame** is responsible for recording the result of the trade and the broker's commission.

The database access methods used in **Frame 5** are a mixture of **Modifies**, **Adds** and **Removes**.

The **EGenTxnHarness** controls the execution of **Frame 5** as follows:

```
{
    comm_amount = (comm_rate / 100) * (trade_qty * trade_price)
    invoke (Trade-Result_Frame-5)
}
```

Trade-Result Frame 5 of 6 Parameters:

Parameter	Direction	Description
broker_id	IN	Broker ID, which was obtained in Frame 1.
comm_amount	IN	The broker commission amount, computed by the EGen code
st_completed_id	IN	The index ID value into STATUS_TYPE for "Completed" status.
trade_dts	IN	Trade date and time provided by the output of Frame 2.
trade_id	IN	The Trade ID for the trade to be settled passed to the transaction by the Market Exchange Emulator.
trade_price	IN	Trade price provided by the Market Exchange Emulator.

Trade-Result_Frame-5 Pseudo-code: Record the trade result and the broker's commission

```
{  
    update  
        TRADE  
    set  
        T_COMM      = comm_amount,  
        T_DTS       = trade_dts,  
        T_ST_ID     = st_completed_id,  
        T_TRADE_PRICE = trade_price  
    where  
        T_ID = trade_id  
  
    insert into  
        TRADE_HISTORY (  
            TH_T_ID,  
            TH_DTS,  
            TH_ST_ID  
        )  
    values (  
        trade_id,  
        trade_dts,  
        st_completed_id  
    )  
  
    update  
        BROKER  
    set  
        B_COMM_TOTAL = B_COMM_TOTAL + comm_amount,  
        B_NUM_TRADES = B_NUM_TRADES + 1  
    where  
        B_ID = broker_id  
}
```

3.3.8.8 Trade-Result Transaction Frame 6 of 6

The sixth **Frame** is responsible for settling the trade.

The database access methods used in **Frame 6** are a mixture **Adds** and **Modifies**.

The **EGenTxnHarness** controls the execution of **Frame 6** as follows:

```

{
    due_date = (trade_date + 2 days)
    if (type_is_sell) then
    {
        se_amount = (trade_qty * trade_price) - charge - comm_amount
    } else {
        se_amount = -((trade_qty * trade_price) + charge + comm_amount)
    }
    if (tax_status == 1) then
    {
        se_amount = se_amount - tax_amount
    }
    invoke (Trade-Result_Frame-6)
}

```

Trade-Result Frame 6 of 6 Parameters:

Parameter	Direction	Description
acct_id	IN	Customer account ID of the customer involved in the Trade-Result transaction, which was obtained in Frame 1.
due_date	IN	Date and time when trade is due to be settled.
s_name	IN	Name of security traded, which was obtained in Frame 4
se_amount	IN	The trade settlement amount.
trade_dts	IN	Date and time of trade result generated by the SUT, and output in Frame 2.
trade_id	IN	The trade ID for the trade to be settled, passed to the transaction by the Market Exchange Emulator.
trade_is_cash	IN	Boolean obtained in Frame 1 indicating trade is for cash (1) or on margin (0).
trade_qty	IN	Quantity of securities traded, which was obtained from Frame 1
type_name	IN	Trade type name, which was obtained in Frame 1.
acct_bal	OUT	Customer account's cash balance (needed for one of the isolation tests)

Trade-Result_Frame-6 Pseudo-code: Settle the trade

```

{
    // Local Frame Variables
    Declare cash_type char(40)
    if (trade_is_cash) then
        cash_type = "Cash Account"
    else
        cash_type = "Margin"
}

```

Trade-Result_Frame-6 Pseudo-code: Settle the trade

```
insert into
    SETTLEMENT (
        SE_T_ID,

        SE_CASH_DUE_DATE,
        SE_AMT
    )
values (
    trade_id,
    cash_type,
    due_date,
    se_amount
)

if (trade_is_cash) then {
    update
        CUSTOMER_ACCOUNT
    set
        CA_BAL = CA_BAL + se_amount
    where
        CA_ID = acct_id

    insert into
        CASH_TRANSACTION (
            CT_DTS,
            CT_T_ID,
            CT_AMT,
            CT_NAME
        )
    values (
        trade_dts,
        trade_id,
        se_amount,
        type_name + " " + trade_qty + " shares of " + s_name
    )
}

select
    acct_bal = CA_BAL
from
    CUSTOMER_ACCOUNT
where
    CA_ID = acct_id

commit transaction
```

Trade-Result_Frame-6 Pseudo-code: Settle the trade

}

3.3.9 The Trade-Status Transaction

The Trade-Status **Transaction** is designed to emulate the process of providing an update on the status of a particular set of trades. It is representative of a customer reviewing a summary of the recent trading activity for one of their accounts.

Trade-Status is invoked by **EGenDriverCE**. It consists of a single **Frame**. For the given account ID, Trade-Status returns the trade ID and status of the 50 most recent trades.

3.3.9.1 Trade-Status Transaction Parameters

The inputs to the Trade-Status **Transaction** are generated by the **EGenDriverCE** code in CETxnInputGenerator.cpp and the data structures defined in TxnHarnessStructs.h must be used to communicate the input and output parameters.

Trade-Status Interfaces	Module/Data Structure
CE Input generation	GenerateTradeStatusInput()
Transaction Input/OutputStructure	TTradeStatusTxnInput TTradeStatusTxnOutput
Frame1 Input/Output Structure	TTradeStatusFrame1Input TTradeStatusFrame1Output

Trade-Satus Transaction Parameters:

Parameter	Direction	Description
acct_id	IN	A single customer is chosen non-uniformly by customer tier, from the range of available customers. The rules for determining the range of available customers are described in clause 3.2.2.1. A single customer account id, as defined by CA_ID in CUSTOMER_ACCOUNT, is chosen at random, uniformly, from the range of customer account ids for the chosen customer.
status	OUT	Code indicating the execution status for this transaction.
status_name[]	OUT	A list of character strings, each character string as defined by ST_NAME in STATUS_TYPE, representing the current status of a trade.
trade_id[]	OUT	A list of numbers, each number as defined by T_ID in TRADE, assigned by the brokerage or exchange to identify the specific trade being requested.

3.3.9.2 Trade-Status Transaction Database Footprint

The Trade-Status **Database Footprint** is as follows:

Trade-Status Database Footprint		
Table	Column	Frame
		1
BROKER	B_NAME	Return
CUSTOMER	C_F_NAME	Return
	C_L_NAME	Return
EXCHANGE	EX_NAME	Return
SECURITY	S_NAME	Return
STATUS_TYPE	ST_NAME	Return
TRADE	T_CHRG	Return
	T_DTS	Return
	T_EXEC_NAME	Return
	T_ID	Return
	T_QTY	Return
	T_S_SYMB	Return
TRADE_TYPE	TT_NAME	Return
Transaction Control		Start Commit

3.3.9.3 Trade-Status Transaction Frame 1 of 1

The database access methods used in **Frame 1** are all **Returns**.

The **EGenTxnHarness** controls the execution of **Frame 1** as follows:

```
{
    invoke (Trade-Status_Frame-1)
    if (num_found <> max_trade_status_len) then
    {
        status = -911
    }
}
```

Trade-Status Frame 1 of 1 Parameters:

Parameter	Direction	Description
acct_id	IN	A single customer is chosen non-uniformly by customer tier, from the range of available customers. The rules for determining the range of available customers are described in clause 3.2.2.1. A single customer account id, as defined by CA_ID in CUSTOMER_ACCOUNT, is chosen at random, uniformly, from the range of customer account ids for the chosen customer.
broker_name	OUT	A character string, as defined by B_NAME in BROKER, representing the name of the broker who executes transactions on behalf of the customer
charge[]	OUT	A list of numbers, each number as defined by T_CHRG in TRADE, representing the cost of executing the trade as charged by the broker.

cust_f_name	OUT	A character string, as defined by C_F_NAME in CUSTOMER, representing the first name of the customer who owns the account (acct_id).
cust_l_name	OUT	A character string, as defined by C_L_NAME in CUSTOMER, representing the last name of the customer who owns the account (acct_id).
ex_name[]	OUT	A list of character strings, each character string as defined by EX_NAME in EXCHANGE, representing the name of the security exchange where the security is traded.
exec_name[]	OUT	A list of character strings, each character string as defined by T_EXEC_NAME in TRADE, representing the name of the person who initiated the trade on behalf of the customer (c_f_name, c_l_name).
num_found	OUT	Number of TRADE rows found.
s_name[]	OUT	A list of character strings, each character string as defined by S_NAME in SECURITY, representing the name of the security as listed with the exchange.
status_name[]	OUT	A list of character strings, each character string as defined by ST_NAME in STATUS_TYPE, representing the current status of the trade.
symbol []	OUT	A list of character strings, each character string as defined by S_SYMB in SECURITY, representing the specific security, as listed with the exchange, being traded in the trade.
trade_dts[]	OUT	A list of dates and times, each data and time as defined by T_DTS in TRADE, at which the Trade-Request was processed by the broker.
trade_id[]	OUT	A list of numbers, each number as defined by T_ID in TRADE, assigned by the brokerage or exchange to identify the specific trade being requested.
trade_qty[]	OUT	A list of numbers, each number as defined by T_QTY in TRADE, representing the quantity of the security being traded in the Trade-Request.
type_name[]	OUT	A list of character strings, each character string as defined by TT_NAME in TRADE_TYPE, representing the type of trade being executed on behalf of the customer.

Trade-Status _ Frame-1 Pseudo-code: Retrieve information on the 50 most recent trades

```

3.3.10 The Trade-Update Transaction

The Trade-Update **Transaction** is designed to emulate the process of making minor corrections or updates to a set of trades. This is analogous to a customer or broker reviewing a set of trades, and discovering that some minor editorial corrections are required. The various sets of trades are chosen such that the work is representative of:

- reviewing general market trends
- reviewing trades for a period of time prior to the most recent account statement
- reviewing past performance of a particular security

Trade-Update is invoked by **EGenDriverCE**. It consists of three mutually exclusive **Frames**. Each **Frame** employs a different technique for looking up historical trade data. Minor corrections are made to the retrieved data.

Frame 1 accepts a list of trade IDs. Information for each of the trades in the list is returned. The executor's name for each trade is modified.

Frame 2 accepts a customer account ID, a start timestamp, end timestamp and a number of trades (N) as inputs. The **Frame** returns information for the first N trades for the specified customer account between the start and end timestamps (inclusive). The settlement cash type for each trade is modified.

Frame 3 accepts a security symbol, a start timestamp, end timestamp and a number of trades (N) as inputs. The **Frame** returns information for the first N trades for the given security between the start and end timestamps (inclusive). For cash trades the description of the **Transaction** is modified.

3.3.10.1 Trade-Update Transaction Parameters

The inputs to the Trade-Update **Transaction** are generated by the **EGenDriverCE** code in **CETxnInputGenerator.cpp**. The data structures defined in **TxnHarnessStructs.h** must be used to communicate the input and output parameters.

Trade-Update Interfaces	Module/Data Structure
CE Input generation	GenerateTradeUpdateInput()
Transaction Input/Output Structure	TTradeUpdateTxnInput TTradeUpdateTxnOutput
Frame 1 Input/Output Structure	TTradeUpdateFrame1Input TTradeUpdateFrame1Output
Frame 2 Input/Output Structure	TTradeUpdateFrame2Input TTradeUpdateFrame2Output
Frame 3 Input/Output Structure	TTradeUpdateFrame3Input TTradeUpdateFrame3Output

Trade-Update Transaction Parameters:

Parameter	Direction	Description
acct_id	IN	Customer account ID. Used when frame_to_execute is 2, otherwise set to 0.
end_trade_dts	IN	Used in Frame 2 as the end point in time for identifying a particular trade for an account. Used in Frame 3 as the end point in time for identifying trades for a particular symbol. For Frame 1, this parameter is ignored, so it is set to an empty date.
frame_to_execute	IN	Identifies which of the mutually exclusive frames to execute.
max_acct_id	IN	Maximum account identifier, used in Frame 3, otherwise set to 0.
max_trades	IN	Maximum number of trades to find. The default value (20) is defined in the TTradeUpdateSettings structure in DriverParameterSettings.h.
max_updates	IN	Maximum number of trades to be modified. The default value (20) is defined in the TTradeUpdateSetting structure in DriverParameterSettings.h.
start_trade_dts	IN	Used in Frame 2 as the point in time for identifying a particular trade for an account. Non-uniform over pre-populated interval. Used in Frame 3 as the point in time for identifying trades for a particular symbol. Uniform over pre-populated interval. For Frame 1, this parameter is ignored, so it is set to an empty date.
symbol	IN	Used in Frame 3 as the security symbol for which to find trades. Uniformly chosen over all securities. For the other frames, symbol is set to the empty string.
trade_id[]	IN	Array of non-uniform randomly chosen trade IDs used by Frame 1 to identify a set of particular trades. For the other frames, array elements are set to 0. For Frame 1, max_trades indicates how many elements are to be used in the array.

frame_executed	OUT	Confirmation of which frame was executed.
is_cash[]	OUT	Indicates whether the trades were cash transactions.
is_market[]	OUT	Indicates whether the trades used in Frame 1 were market order trades.
num_found	OUT	Number of trade rows found for frames 1, 2 and 3.
num_updated	OUT	Number of trade rows modified for frames 1, 2 and 3.
status	OUT	Code indicating the execution status for this transaction.
trade_list[]	OUT	List of trade IDs found in Frames 2 and 3.

3.3.10.2 Trade-Update Transaction Database Footprint

The Trade-Update **Database Footprint** is as follows:

Trade-Update Database Footprint				
Table	Column	Frame		
		1*	2*	3*
CASH_TRANSACTION	CT_AMT	Return*	Return*	Return*
	CT_DTS	Return*	Return*	Return*
	CT_NAME	Return*	Return*	Modify* Return*

SETTLEMENT	SE_AMT	Return	Return	Return
	SE_CASH_DUE_DATE	Return	Return	Return
	SE_CASH_TYPE	Return	Modify Return	Return
TRADE	T_BID_PRICE	Return	Return	
	T_CA_ID			Return
	T_DTS		Reference	Reference
	T_EXEC_NAME	Modify Return	Return	Return
	T_ID		Return	Return
	T_IS_CASH	Return	Return	Return
	T_QTY			Return
	T_S_SYMB			Reference
	T_TRADE_PRICE	Return	Return	Return
TRADE_HISTORY	T_TT_ID			Return
	TH_DTS	Return	Return	Return
TRADE_TYPE	TH_ST_ID	Return	Return	Return
	TT_IS_MRKT	Return		
	TT_NAME			Return
	Transaction Control	Start Commit	Start Commit	Start Commit

3.3.10.3 Trade-Update Transaction Frame 1 of 3

The first **Frame** is responsible for retrieving information about the specified array of trade IDs and modifying some data from the TRADE table.

The **EGenTxnHarness** controls the execution of **Frame 1** as follows:

```
{
    if( frame_to_execute == 1 )

    {
        invoke (Trade-Update_Frame-1)

        if (num_found != max_trades) or (num_updated != max_updates) then
        {

            status = -1011

        }

        frame_executed = 1
    }

[...]
}
```

Trade-Update Frame 1 of 3 Parameters:

Parameter	Direction	Description
max_trades	IN	Number of valid array elements in trade_id[]. The default value (20) is set in TTradeUpdateSettings.MaxRowsFrame1 in DriverParameterSettings.h.
max_updates	IN	Maximum number of TRADE rows to modify. The default value (20) is set in TTradeUpdateSettings.MaxRowsToUpdateFrame1 in DriverParameterSettings.h. Must be <= max_trades.
trade_id[]	IN	The array of trade IDs picked non-uniformly over the set of pre-populated trades.
bid_price[]	OUT	The requested unit price.
cash_transaction_amount[]	OUT	Amount of the cash transaction.
cash_transaction_dts[]	OUT	Date and time stamp of when the transaction took place.
cash_transaction_name[]	OUT	Description of the cash transaction.
exec_name[]	OUT	Name of the person who executed the trade.
is_cash[]	OUT	Flag that is non-zero for a cash trade, zero for a margin trade.
is_market[]	OUT	Flag that is non-zero for a market trade, zero for a limit trade.
num_found	OUT	Number of trade rows returned; should be the same as max_trades.
num_updated	OUT	Number of TRADE rows that were modified; should be the same as max_updates.
settlement_amount[]	OUT	Cash amount of settlement.
settlement_cash_due_date[]	OUT	Date by which customer or brokerage must receive the cash.
settlement_cash_type[]	OUT	Type of cash settlement involved: cash or margin.
trade_history_dts[][3]	OUT	Array of timestamps of when the trade history was updated.
trade_history_status_id[][3]	OUT	Array of status type identifiers.
trade_price[]	OUT	Unit price at which the security was traded.

Trade-Update_Frame-1 Pseudo-code: Get trade information for each trade ID in the trade_id array and modify some of the TRADE rows.

```
{  
    declare i int  
    declare ex_name char(49)  
    start transaction  
  
    num_found = 0  
    num_updated = 0  
  
    for (i = 0; i++; i < max_trades) do {  
        // Get trade information  
        if (num_updated < max_updates) then {  
            // Modify the TRADE row for this trade.  
  
            select  
                ex_name = T_EXEC_NAME  
            from  
                TRADE  
            where  
                T_ID = trade_id[i]  
  
            num_found = num_found + row_count  
  
            if (ex_name like "% X %") then  
                select ex_name = REPLACE (ex_name, " X ", "")  
            else  
                select ex_name = REPLACE (ex_name, " ", " X ")  
  
            update  
                TRADE  
            set  
                T_EXEC_NAME = ex_name  
            where  
                T_ID = trade_id[i]  
  
            num_updated = num_updated + row_count  
        }  
  
        // Will only return one row for each trade  
        select  
            bid_price[i]      = T_BID_PRICE,  
            exec_name[i]     = T_EXEC_NAME,  
            is_cash[i]       = T_IS_CASH,  
            is_market[i]     = TT_IS_MRKT,
```

Trade-Update_Frame-1 Pseudo-code: Get trade information for each trade ID in the trade_id array and modify some of the TRADE rows.

```
trade_price[i] = T_TRADE_PRICE
from
TRADE,
TRADE_TYPE
where
T_ID = trade_id[i] and
T_TT_ID = TT_ID

// Get settlement information
// Will only return one row for each trade
select
settlement_amount[i]      = SE_AMT,
settlement_cash_due_date[i] = SE_CASH_DUE_DATE,
settlement_cash_type[i]    = SE_CASH_TYPE
from
SETTLEMENT
where
SE_T_ID = trade_id[i]

// get cash information if this is a cash transaction
// Will only return one row for each trade that was a cash transaction
if (is_cash[i]) then {
select
cash_transaction_amount[i] = CT_AMT,
cash_transaction_dts[i]    = CT_DTS,
cash_transaction_name[i]   = CT_NAME
from
CASH_TRANSACTION
where
CT_T_ID = trade_id[i]
}
// read trade_history for the trades
// Will return 2 or 3 rows per trade
select first 3 rows
trade_history_dts[i][]     = TH_DTS,
trade_history_status_id[i][] = TH_ST_ID
from
TRADE_HISTORY
where
TH_T_ID = trade_id[i]
order by
TH_DTS
} // end for loop

commit transaction
```

Trade-Update_Frame-1 Pseudo-code: Get trade information for each trade ID in the trade_id array and modify some of the TRADE rows.

}

3.3.10.4 Trade-Update Transaction Frame 2 of 3

The second **Frame** returns information for the first N trades executed for the specified customer account between a specified start time and end time and modifies the SETTLEMENT row for each trade returned. If the specified start time is too close to the specified end time, then it is possible that fewer than N trades may be returned and SETTLEMENT rows modified.

The **EGenTxnHarness** controls the execution of **Frame 2** as follows:

```
[...]  
else if( frame_to_execute == 2 )  
{  
    invoke (Trade-Update_Frame-2)  
    if (num_updated != num_found) or (num_updated < 0)  
        or (num_found > max_trades) then  
    {  
        status = -1021  
    }  
    else if (num_updated == 0) then  
    {  
        status = +1021  
    }  
    frame_executed = 2  
}  
[...]
```

Trade-Update Frame 2 of 3 Parameters:

Parameter	Direction	Description
acct_id	IN	A single customer is chosen non-uniformly by customer tier, from the range of available customers. The rules for determining the range of available customers are described in clause 3.2.2.1. A single customer account id, as defined by CA_ID in CUSTOMER_ACCOUNT, is chosen at random, uniformly, from the range of customer account ids for the chosen customer.
end_trade_dts	IN	Point in time at which to stop the search for N trades.
max_trades	IN	Maximum number of trades to return. The default value (20) is set in TTradeUpdateSettings.MaxRowsFrame2 in DriverParameterSettings.h.
max_updates	IN	Maximum number of SETTLEMENT rows to modify. The default value (20) is set in TTradeUpdateSettings.MaxRowsToUpdateFrame2 in DriverParameterSettings.h.

start_trade_dts	IN	Point in time from which to search for N trades.
bid_price[]	OUT	The requested unit price.
cash_transaction_amount[]	OUT	Amount of the cash transaction.
cash_transaction_dts[]	OUT	Date and time stamp of when the transaction took place.
cash_transaction_name[]	OUT	Description of the cash transaction.
exec_name[]	OUT	Name of the person who executed the trade.
is_cash[]	OUT	Flag that is non-zero for a cash trade, zero for a margin trade.
num_found	OUT	Number of trade rows returned.
num_updated	OUT	Number of SETTLEMENT rows that were modified.
settlement_amount[]	OUT	Cash amount of settlement.
settlement_cash_due_date[]	OUT	Date by which customer or brokerage must receive the cash.
settlement_cash_type[]	OUT	Type of cash settlement involved: cash or margin.
trade_history[][3]	OUT	Array of timestamps of when the trade history was updated.
trade_history_status_id[][3]	OUT	Array of status type identifiers.
trade_list[]	OUT	Trade ID actually used for retrieving data.
trade_price[]	OUT	Unit price at which the security was traded.

Trade-Update_Frame-2 Pseudo-code : Get trade information for the first N trades of a given customer account from a given point in time and modify some of the SETTLEMENT rows.

```
{
    declare i int
    declare cash_type char(40)
    start transaction

    // Get trade information
    // Will return between 0 and max_trades rows
    select first max_trades rows
        bid_price[]      = T_BID_PRICE,
        exec_name[]     = T_EXEC_NAME,
        is_cash[]       = T_IS_CASH,
        trade_list[]    = T_ID,
        trade_price[]   = T_TRADE_PRICE
    from
        TRADE
    where
        T_CA_ID = acct_id and
        T_DTS >= start_trade_dts and
        T_DTS <= end_trade_dts
    order by
        T_DTS asc
```

Trade-Update_Frame-2 Pseudo-code : Get trade information for the first N trades of a given customer account from a given point in time and modify some of the SETTLEMENT rows.

```

    from
        CASH_TRANSACTION
    where
        CT_T_ID = trade_list[i]
}

// read trade_history for the trades
// Will return 2 or 3 rows per trade
select first 3 rows
    trade_history_dts[i][]      = TH_DTS,
    trade_history_status_id[i][] = TH_ST_ID
from
    TRADE_HISTORY
where
    TH_T_ID = trade_list[i]
order by
    TH_DTS

} // end for loop

commit transaction
}
```

3.3.10.5 Trade-Update Transaction Frame 3 of 3

The third **Frame** returns information for the first N trades for a given security between a specified start time and end time and modifies the related CASH_TRANSACTION row for each trade returned. If the specified start time is too close to the specified end time, then it is possible that fewer than N trades may be returned and CASH_TRANSACTION rows modified.

The **EGenTxnHarness** controls the execution of **Frame 3** as follows:

```
[...]
else if( frame_to_execute == 3 )
{
    invoke (Trade-Update_Frame-3)
    if (num_found < 1) or (num_found > max_trades) then
    {
        status = +1031
    }
    frame_executed = 3
}
}
```

Trade-Update Frame 3 of 3 Parameters:

Parameter	Direction	Description
end_trade_dts	IN	Point in time at which to stop search.
max_acct_id	IN	Maximum customer account identifier.
max_trades	IN	Number of trades to find. The default value (20) is set in TTradeUpdateSettings.MaxRowsFrame3 in DriverParameterSettings.h.
max_updates	IN	Number of CASH_TRANSACTION rows to modify. The default value (20) is set in TTradeUpdateSettings.MaxRowsToUpdateFrame3 in DriverParameterSettings.h.
start_trade_dts	IN	Point in time from which to start search.
symbol	IN	Security for which to find trades.
acct_id[]	OUT	Array of accounts for which the trades were done.
cash_transaction_amount[]	OUT	Amount of the cash transaction.
cash_transaction_dts[]	OUT	Date and time stamp of when the transaction took place.
cash_transaction_name[]	OUT	Description of the cash transaction.
exec_name[]	OUT	Array of name of the person who executed each of the trades.
is_cash[]	OUT	Flag that is non-zero for a cash trade, zero for a margin trade.
num_found	OUT	Number of TRADE rows returned.
num_updated	OUT	Number of CASH_TRANSACTION rows modified.
price[]	OUT	Array of the price that was paid in each trade.
quantity[]	OUT	Array of the quantity of security bought in each trade.
s_name[]	OUT	Name of the security traded.
settlement_amount[]	OUT	Cash amount of settlement.
settlement_cash_due_date[]	OUT	Date by which the customer or brokerage must receive the cash.
settlement_cash_type[]	OUT	Type of cash settlement involved: cash or margin.
trade_dts[]	OUT	Array of the timestamps for when the trade was requested.
trade_history_dts[][3]	OUT	Array of timestamps of when the trade history was updated.
trade_history_status_id[][3]	OUT	Array of status type identifiers.
trade_list[]	OUT	Array of T_IDs found.

type_name[]	OUT	Array of the trade type name for each trade.
trade_type[]	OUT	Array of the trade type for each trade.

Trade-Update_Frame-3 Pseudo-code: Get a list of N trades executed for a certain security starting from a given point in time and modify some of the CASH_TRANSACTION rows.

commit transaction
}
```

3.3.11 The Data-Maintenance Transaction

The Data-Maintenance **Transaction** is designed to emulate the periodic modifications to data that is mainly static and used for reference. This is analogous to updating

Data-Maintenance is invoked by **EGenDriverDM**. It consists of one **Frame**. This **Transaction** runs once per minute. It simulates periodic modifications to data tables that are mainly used for reference by the other **Transactions**. The **Driver** provides as input the name of the table to be modified by the **Transaction**.

Each time this **Transaction** is run the **Driver** alters the next table in the list. This means that each table in the list will only get altered once every twelve minutes.

The following is the list of table names that can be passed as arguments to this **Transaction**:

- ACCOUNT_PERMISSION
- ADDRESS
- COMPANY
- CUSTOMER
- CUSTOMER_TAXRATE
- DAILY_MARKET
- EXCHANGE
- FINANCIAL
- NEWS_ITEM
- SECURITY

- TAXRATE
- WATCH_ITEM

The Data-Maintenance **Transaction** consists of a single **Frame**.

The intent of the **Transaction** is to alter data tables that would not otherwise be written to by the benchmark. The **EGenTxnHarness** will pick the next table in the list to alter, each time this **Transaction** is run.

Below is a description of what kind of alteration is done to each table when that table is selected:

1. ACCOUNT_PERMISSION - The **EGenTxnHarness** will pass a customer account identifier to the Data-Maintenance **Transaction**. Each customer account will have at least one row in the ACCOUNT_PERMISSION table. The first ACCOUNT_PERMISSION row for the customer will be found (The **Sponsor** may decide which row is first). That row in the ACCOUNT_PERMISSION table will have an Access Control List (AP_ACL). That access control list will be updated to 1111 if it is not already 1111. If the access control list is already 1111, the access control list will be updated to 0011.
2. ADDRESS - 67% of the time **EGenTxnHarness** will pass a customer identifier to the Data-Maintenance **Transaction**. The other 33% of the time **EGenTxnHarness** will pass a company identifier to the Data-Maintenance **Transaction**. That customer's or company's ADDRESS will be modified. The AD_LINE2 will be set to "Apt. 10C" or to "Apt. 22" if it was already "Apt. 10C".
3. COMPANY - The **EGenTxnHarness** will pass a company identifier to the Data-Maintenance **Transaction**. That company's Standard and Poor credit rating will be updated to "ABA" or to "AAA" if it was already "ABA".
4. CUSTOMER - The **EGenTxnHarness** will pass a customer identifier to the Data-Maintenance **Transaction**. The ISP part of that customer's second email address (C_EMAIL_2) will be updated to "@mindspring.com" or to "@earthlink.com" if it was already "@mindspring.com".
5. CUSTOMER_TAXRATE - The **EGenTxnHarness** will pass a customer identifier to the Data-Maintenance **Transaction**. The country tax rate will be modified cyclically to the next rate in the set {"US1", "US2", "US3", "US4", "US5"} or in the set {"CN1", "CN2", "CN3", "CN4"}, depending on the customer's country.
6. DAILY_MARKET - The **EGenTxnHarness** will pass a security symbol, a day of the month, and a random number (positive or negative) to the Data-Maintenance **Transaction**. All rows in DAILY_MARKET with matching symbol and day of the month will be updated by adding the random number to DM_VOL.
7. EXCHANGE - The **EGenTxnHarness** will not pass any additional information to the Data-Maintenance **Transaction**. There are only four rows in the EXCHANGE table. Every row will have its EX_DESC updated. If EX_DESC does not already end with "LAST UPDATED " and a date and time, that string will be appended to EX_DESC. Otherwise the date and time at the end of EX_DESC will be updated to the current date and time.
8. FINANCIAL - The **EGenTxnHarness** will pass a company identifier to the Data-Maintenance **Transaction**. That company's FI_QTR_START_DATES will be updated to the second of the month or to the first of the month if the dates were already the second of the month.
9. NEWS_ITEM - The **EGenTxnHarness** will pass a company identifier to the Data-Maintenance **Transaction**. The NI_DTS for that company's news items will be updated by one day.
10. SECURITY - The **EGenTxnHarness** will pass in a security symbol. That security's S_EXCH_DATE will be incremented by one day.

11. TAXRATE - The **EGenTxnHarness** will pass in tax rate identifier to the Data-Maintenance **Transaction**. That tax rate's TX_NAME will be updated so that a substring will be toggled between "Tax" and "tax".
12. WATCH_ITEM - The **EGenTxnHarness** will pass in a customer identifier to the Data-Maintenance **Transaction**. The middle security in the customer's WATCH_ITEM list will be selected. It will be modified to be the next symbol in the SECURITY table that is not already in the customer's WATCH_ITEM list.

3.3.11.1 Transaction Parameters

The inputs to the Data-Maintenance **Transaction** are generated by the **EGenDriverDM** in DM.cpp. The data structures defined in TxnHarnessStructs.h must be used to communicate the input and output parameters.

Data-Maintenance Interfaces	Module/Data Structure
Input generation	GenerateDataMaintenanceInput()
Transaction Input/Output Structure	TDataMaintenanceTxnInput TDataMaintenanceTxnOutput
Frame 1 Input/Output Structure	TDataMaintenanceFrame1Input TDataMaintenanceFrame1Output

Data-Maintenance Transaction Parameters:

Parameter	Direction	Description
acct_id	IN	A single customer is chosen non-uniformly by customer tier, from the range of available customers. A single customer account id, as defined by CA_ID in CUSTOMER_ACCOUNT, is chosen at random, uniformly, from the range of customer account ids for the chosen customer. This input is used when table_name is "ACCOUNT_PERMISSION", otherwise it is set to 0.
c_id	IN	A number randomly selected from the possible customer identifiers as defined by C_ID in CUSTOMER table using a uniform distribution. This input is always used when table_name is "CUSTOMER", "CUSTOMER_TAXRATE" or "WATCH_ITEM". This input (instead of co_id) is used 67% of the time when table_name is "ADDRESS". Otherwise this input is set to 0.
co_id	IN	A number randomly selected from the possible company identifiers as defined by CO_ID in COMPANY table using a uniform distribution. This input is always used when table_name is "COMPANY", "FINANCIAL" or "NEWS_ITEM". This input (instead of c_id) is used 33 % of the time when table_name is "ADDRESS". Otherwise this input is set to 0.
day_of_month	IN	A number randomly selected from 1 to 31 with a uniform distribution. This input is only used when table_name is "DAILY_MARKET", otherwise it is set to 0. When table_name is "DAILY_MARKET" all the rows with this day of the Month in DM_DATE are modified.
symbol	IN	A string containing a Security Symbol. The security symbol string follows the definition of S_SYMBOL in the SECURITY table. This input is only used when table_name is "DAILY_MARKET", or "SECURITY", otherwise it is set to empty string.
table_name	IN	A string containing the name of the table to be altered. Valid values are "ACCOUNT_PERMISSION", "ADDRESS", "COMPANY", "CUSTOMER", "CUSTOMER_TAXRATE", "DAILY_MARKET", "EXCHANGE", "FINANCIAL", "NEWS_ITEM", "SECURITY", "TAXRATE", "WATCH_ITEM". This input is always used.
tx_id	IN	A string containing a tax identifier. The tax identifier string follows

		the definition of TX_ID in the TAXRATE table. This input is only used when table_name is "TAXRATE", otherwise it is set to empty string.
vol_incr	IN	A randomly selected positive or negative number. This number is only used when the table_name is "DAILY_MARKET", otherwise vol_incr is set to 0 and ignored. When table_name is "DAILY_MARKET" this number is added to DM_VOL.
status	OUT	Code indicating the execution status for this transaction.

3.3.11.2 Data-Maintenance Transaction Database Footprint

This **Transaction** includes a mix of Reference, Modify, Remove and Add operations. The **Transaction** implementation would potentially require access to the following database tables and columns.

Data-Maintenance Database Footprint		
Table Name	Column	Frame
		1
ACCOUNT_PERMISSION	AP_ACL	Reference * Modify *
	AP_CA_ID	Reference *
	Count(*)	Reference *
ADDRESS	AD_ID	Reference *

Transaction Control		Start Commit

3.3.11.3 Data-Maintenance Transaction Frame 1 of 1

The EGenTxnHarness controls the execution of **Frame 1** as follows:

```
{
    invoke (Data-Maintenance_Frame-1)
}
```

Data-Maintenance Frame 1 of 1 Parameters:

Parameter	Direction	Description
acct_id	IN	A single customer is chosen non-uniformly by customer tier, from the range of available customers. A single customer account id, as defined by CA_ID in CUSTOMER_ACCOUNT, is chosen at random, uniformly, from the range of customer account ids for the chosen customer. This input is used when table_name is "ACCOUNT_PERMISSION", otherwise it is set to 0.
c_id	IN	A number randomly selected from the possible customer identifiers as defined by C_ID in CUSTOMER table using a uniform distribution. This input is always used when table_name is "CUSTOMER", "CUSTOMER_TAXRATE" or "WATCH_ITEM". This input (instead of co_id) is used 67% of the time when table_name is "ADDRESS". Otherwise this input is set to 0.
co_id	IN	A number randomly selected from the possible company identifiers as defined by CO_ID in COMPANY table using a uniform distribution. This input is always used when table_name is "COMPANY", "FINANCIAL" or "NEWS_ITEM". This input (instead of c_id) is used 33 % of the time when table_name is "ADDRESS". Otherwise this input is set 0.
day_of_month	IN	A number randomly selected from 1 to 31 with a uniform distribution. This input is only used when table_name is "DAILY_MARKET", otherwise it is set to 0. When table_name is "DAILY_MARKET" all the rows with this day of the Month in DM_DATE are modified.
symbol	IN	A string containing a Security Symbol. The security symbol string follows the definition of S_SYMB in the SECURITY table. This input is only used when table_name is "DAILY_MARKET", or "SECURITY", otherwise it is set to empty string.

table_name	IN	A string containing the name of the table to be altered. Valid values are "ACCOUNT_PERMISSION", "ADDRESS", "COMPANY", "CUSTOMER", "CUSTOMER_TAXRATE", "DAILY_MARKET", "EXCHANGE", "FINANCIAL", "SECURITY", "TAXRATE", "WATCH_ITEM". This input is always used.
tx_id	IN	A string containing a tax identifier. The tax identifier string follows the definition of TX_ID in the TAXRATE table. This input is only used when table_name is "TAXRATE", otherwise it is set to empty string.
vol_incr	IN	A randomly selected positive or negative number. This number is only used when the table_name is "DAILY_MARKET", otherwise vol_incr is set to 0 and ignored. When table_name is "DAILY_MARKET" this number is added to DM_VOL.

Data-Maintenance Frame 1 Pseudo-code: Update a table

```

/* Check which table is to be updated. */
if (strcmp(table_name, "ACCOUNT_PERMISSION") == 0) {

    //ACCOUNT_PERMISSION
    //Update the AP_ACL to "1111" or "0011" in rows for a
    //customer account of c_id.

3.3.12 The Trade-Cleanup Transaction

The Trade-Cleanup **Transaction** is used to cancel any pending or submitted trades from the database. The **Sponsor** may use **EGenTxnHarness** to call Trade-Cleanup or may invoke the **Transaction** by other means.

Trade-Cleanup is used to bring the database to a known state before the start of a **Test Run**.

The Trade-Cleanup **Transaction** consists of a single **Frame**. The Trade-Cleanup **Transaction** may be implemented using more than one **Database Transaction**.

3.3.12.1 Trade-Cleanup Transaction Parameters

The inputs to the Trade-Cleanup **Transaction** are supplied by the **Sponsor**. The data structures defined in TxnHarnessStructs.h must be used to communicate the input and output parameters.

Trade-Cleanup Interfaces	Module/Data Structure
Transaction Input/Output Structure	TTradesCleanupTxnInput TTradesCleanupTxnOutput
Frame 1 Input/Output Structure	TTradesCleanupFrame1Input TTradesCleanupFrame1Output

Trade-Cleanup Transaction Parameters:

Parameter	Direction	Description
st_canceled_id	IN	Identifier for the "Canceled" trade order status - passed in for ease of benchmarking.
st_pending_id	IN	Identifier for the "Pending" trade order status - passed in for ease of benchmarking.
st_submitted_id	IN	Identifier for the "Submitted" trade order status - passed in for ease of benchmarking.
trade_id	IN	The trade identifier to be used as the start for handling outstanding submitted and/or pending limit trades.

3.3.12.2 Trade-Cleanup Transaction Database Footprint

The Trade-Cleanup **Database Footprint** is as follows:

Trade-Cleanup Database Footprint		
Table	Column	Frame
		1
TRADE	T_DTS	Modify
	T_ID	Reference
	T_ST_ID	Modify
TRADE_HISTORY	Row(s)	Add
TRADE_REQUEST	Row(s)	Remove
	TR_T_ID	Reference
Transaction Control		Start Commit

3.3.12.3 Trade-Cleanup Transaction Frame 1 of 1

The database access methods used in **Frame 1** are a mixture of **References**, **Modifies**, **Removes** and **Adds**.

If **EGenTxnHarness** is used to invoke the **Frame**, it controls the execution of **Frame 1** as follows:

```
{  
    invoke (Trade-Cleanup_Frame-1)  
}
```

Trade-Cleanup Frame 1 of 1 Parameters:

Parameter	Direction	Description
st_canceled_id	IN	Identifier for the “Canceled” trade order status – passed in for ease of benchmarking.
st_pending_id	IN	Identifier for the “Pending” trade order status – passed in for ease of benchmarking.
st_submitted_id	IN	Identifier for the “Submitted” trade order status – passed in for ease of benchmarking.
trade_id	IN	The trade identifier to be used as the start for handling outstanding submitted and/or pending limit trades.

Trade-Cleanup_Frame-1 Pseudo-code: cancel pending and submitted trades

```
{  
    start transaction  
  
    Declare t_id          TRADE_T  
    Declare tr_t_id       TRADE_T  
    Declare now_dts      DATETIME  
  
    /* Find pending trades from TRADE_REQUEST */  
  
    declare pending_list for  
    select  
        TR_T_ID  
    from  
        TRADE_REQUEST  
    order by  
        TR_T_ID  
  
    open pending_list  
  
    /* Insert a submitted followed by canceled record into TRADE_HISTORY, mark the trade  
    canceled and delete the pending trade */  
  
    do until (end_of_pending_list) {
```

Trade-Cleanup_Frame-1 Pseudo-code: cancel pending and submitted trades

```
fetch from
    pending_list
into
    tr_t_id

    get_current_dts ( now_dts )

insert into
    TRADE_HISTORY (
        TH_T_ID, TH_DTS, TH_ST_ID
    )
values (
    tr_t_id,           // TH_T_ID
    now_dts,          // TH_DTS
    st_submitted_id  // TH_ST_ID
)

update
    TRADE
set
    T_ST_ID = st_canceled_id,
    T_DTS = now_dts
where
    T_ID = tr_t_id

insert into
    TRADE_HISTORY (
        TH_T_ID, TH_DTS, TH_ST_ID
    )
values (
    tr_t_id,           // TH_T_ID
    now_dts,          // TH_DTS
    st_canceled_id   // TH_ST_ID
)

} //end of pending_list

/* Remove all pending trades */
delete
from
    TRADE_REQUEST

/* Find submitted trades, change the status to canceled and insert a canceled record
into TRADE_HISTORY*/
declare submit_list for
select
```

Trade-Cleanup_Frame-1 Pseudo-code: cancel pending and submitted trades

```
T_ID
from
TRADE
where
T_ID >= trade_id and

open submit_list

do until (end_of_submit_list) {
fetch from
submit_list
into
t_id

get_current_dts ( now_dts )

/* Mark the trade as canceled, and record the time */
update
TRADE
set
T_ST_ID = st_canceled_id
T_DTS = now_dts
where
T_ID = t_id

insert into
TRADE_HISTORY (
TH_T_ID, TH_DTS, TH_ST_ID
)
values (
t_id,           // TH_T_ID
now_dts,        // TH_DTS
st_canceled_id // TH_ST_ID
)

} //end of submit_list

commit transaction
}
```

CLAUSE 4 -- DESCRIPTION OF SUT, DRIVER, AND NETWORK

4.1 Overview

TPC-E is a distillation of an abstraction of a “real-world” OLTP environment. In order to understand what TPC-E tests and, as a consequence, what TPC-E does not test, it is necessary to understand the base “real-world” environment (Clause 4.1.1 Description of Real-World OLTP Environment), the abstraction of that base environment (Clause 4.1.2 Functional Component Abstraction of the Real-World OLTP Environment) and the distillation of that abstraction (Clause 4.1.3 Distillation of Functional Components into the TPC-E Environment).

4.1.1 Description of the Real-World OLTP Environment

The figure below shows the “real-world” environment upon which TPC-E is based. Users connect to the brokerage house over a network using a myriad of possible interface devices (e.g. PCs or handheld units). The brokerage house is also able to connect via a network to external businesses (e.g. the stock market exchanges).

Figure 4.a - Diagram of the Real-World OLTP Environment

4.1.2 Functional Component Abstraction of the Real-World OLTP Environment

From the diagram of the real-world OLTP environment, the following diagram of the key functional components can be abstracted.

Figure 4.b - Abstraction of the Functional Components in an OLTP Environment

A user makes use of some device to connect, via the network, to the business's presentation services. As is typical in a Customer-to-Business environment, the presentation layer provides a way for the user to navigate the available services, select the desired operation, enter data and read results. A practical example of this would be a customer using a home PC to connect to a web site to conduct business.

The brokerage house would likewise connect via a network to an external business, such as the market exchange. As is typical of a Business-to-Business environment, presentation services are not needed. Rather, data can be exchanged directly without the need for a human-readable format.

Regardless of how the data arrives at the brokerage house, it ultimately will pass through transaction management functions where connection multiplexing/de-multiplexing occurs; routing may also occur here as well as other possible functions. The transaction management layer ensures the data will be delivered to the right business logic code that can perform the requested task.

A critical step in the business logic occurs when the data is handed off to some function or method implementation for database processing. This method implementation will include **Database Interface** code for packaging up the appropriate data and sending it to the database application logic (e.g. stored SQL procedure) running in the context of the **DBMS**. The database application logic will then use **DBMS** services to perform the necessary tasks, and the results will ultimately be returned "up-stream" as appropriate.

4.1.3 Distillation of Functional Components into the TPC-E Environment

By design, TPC-E is database-centric. Therefore, even though Presentation Services are an important part of a complete Customer-to-Business solution, they have been distilled out of the TPC-E workload. As a practical matter, Presentation Services often scale out such that a **Test Sponsor** will configure (replicate) enough servers to run the Presentation Services so they are not a limiting factor for the benchmark. So, to focus on what is being evaluated and to facilitate ease of benchmarking, Presentation Services are not a functional component in the test configuration.

In the context of the diagram of the functional components of the target system model, the role of the Customer is that of a decision maker and data provider (i.e., deciding what transaction to do and supplying the necessary inputs for that transaction). However, the absence of Presentation Services in TPC-E leads to some simplifications in the test configuration emulation of the User. The decision making and data input generation characteristics of the User are still essential, but characteristics of the User like typing rates and think times are not necessary.

The role of the User Interface Device (UID) is to accept inputs from the User and send those inputs to the Presentation Services, and accept outputs from the Presentation Services and display those outputs to the User. However, TPC-E does not define or require display layouts (since there are no Presentation Services). Consequently there is no requirement to transmit transaction input and output data in a display format. For example, there is no need to send and receive fully formed HTML pages via HTTP; transaction inputs and outputs may be communicated in a binary format (i.e. by sending C++ data structures over a socket).

Based on these items and the diagram of the functional components of the target system model, a diagram for the functional components of the test configuration can be derived. Note that the implementation of these functional components implies a combination of hardware and software.

Figure 4.c - Functional Components of the Test Configuration

- 4.1.3.1 **Driving & Reporting** – **Sponsor** provided functionality to set up, administer and execute a **Test Run**, collect data and generate summary reports. The **Sponsor** written code must invoke **EGenDriver** through a **TPC Defined Interface**.
- 4.1.3.2 **CE** – **Sponsor** provided functionality to set up, administer and execute the **Customer Emulator**. The **Sponsor** written code must invoke **EGenDriverCE**.
- 4.1.3.3 **MEE** – **Sponsor** provided functionality to set up, administer and execute the **Market-Exchange Emulator**. The **Sponsor** written code must invoke **EGenDriverMEE**.

- 4.1.3.4 **DM - Sponsor** provided functionality to set up, administer and execute the Data-Maintenance **Transaction** once a minute. The **Sponsor** may also provide functionality to call the Trade-Cleanup **Transaction** once prior to the start of the run (see description of **EGenDriverDM** below). The **Sponsor** written code must invoke **EGenDriverDM**.
- 4.1.3.5 A **TPC Defined Interface** is a C++ class member which is designed to exchange data (and transfer execution control) between the **Sponsor**-provided **Driver/SUT** code and the TPC-provided **Driver/SUT** code. The table in appendix A.14 lists the **TPC Defined Interfaces** and the associated C++ classes and member functions.
- 4.1.3.6 **EGenDriver** – TPC provided C++ source code that implements essential functionality during a **Test Run**. The use of **EGenDriver** is mandatory. The following are parts of **EGenDriver**.
- **EGenDriverCE** – **Customer Emulator** that provides the required **Transaction Mix** and user input data generation
 - **EGenDriverMEE** – **Market Exchange Emulator** that provides the stock market functionality and data generation
 - **EGenDriverDM** – Data-maintenance functionalities that generates data for and invokes the Data-Maintenance **Transaction**. Also, supplies an interface that can be used by the **Sponsor** to invoke the Trade-Cleanup **Transaction**.
- 4.1.3.7 **EGenDriver Connector** – **Sponsor** provided functionality that complies with a **TPC Defined Interface**. The **EGenDriver Connector** is invoked from inside **EGenDriver** through the interface. The **EGenDriver Connector** is responsible for sending the **EGenDriver** generated data to, and receiving the corresponding resultant data back from, the **EGenTxnHarness Connector** via the **Network**. An example of the hardware and software needed to implement the Connector is:
- **Sponsor** written code
 - An **Operating System** that provides a socket API and the underlying functionality
 - The hardware system the **Operating System** runs on and the network interface card necessary to connect to the **Network** (the network cable coming out of the NIC to connect it to the **Network** would not be considered part of the Connector but rather part of the **Network**).
- 4.1.3.8 **Network** – **Sponsor** provided functionality that must support communication through an industry standard communications protocol using a physical means. One outstanding feature of the **Connector - Network** – Connector communication is that it follows the relevant standards and must imply more than just an application package. It must be possible to have concurrent use of the means by other applications. Physical transport of the data is required and the underlying means of this transport must be capable of operating over arbitrary globally geographic distances. TPC/IP over a local area network is an example of an acceptable **Network** implementation.
- 4.1.3.9 **EGenTxnHarness Connector** – **Sponsor** provided functionality responsible for receiving the data sent from, and sending the appropriate resultant data back to, the **EGenDriver Connector** via the **Network**. The **EGenTxnHarness Connector** provides the data to, and accepts the resultant data from, **EGenTxnHarness** by invoking a **TPC Defined Interface**. The **EGenDriver Connector** example implementation above applies here as well.
- 4.1.3.10 **EGenTxnHarness** – TPC provided C++ source code that implements essential functionality during a **Test Run**. **EGenTxnHarness** invokes the **Sponsor's** implementations of the **Transaction Frames**, providing the necessary inputs and accepting the necessary outputs through a **TPC Defined Interface**. The use of **EGenTxnHarness** is mandatory.

- 4.1.3.11 **Frame Implementation – Sponsor** provided functionality that accepts inputs from, and provides outputs to, **EGenTxnHarness** through a **TPC Defined Interface**. The **Frame Implementation** and all down-stream functional components are responsible for providing the appropriate functionality outlined in the **Transaction Profiles** (Clause 3.3).
- 4.1.3.12 **Database Interface** – Commercially available product used by the **Frame Implementation** to communicate with the **Database Server**. It is possible that the **Database Interface** may communicate with the **Database Server** over a **Network**, but this is not a requirement.
- 4.1.3.13 **Database Server** – Commercially available product(s). **Sponsor** provided logic may run in the context of the **Database Server** (e.g. a stored SQL procedure). An example of a **Database Server** is:
- commercially available **DBMS** running on a
 - commercially available **Operating System** running on a
 - commercially available hardware system utilizing
 - commercially available storage
- 4.1.3.14 **Database Logic** – **Sponsor** written **Frame implementation** logic (e.g. stored SQL procedure)
- Comment:** **EGenDriver Connector** and **EGenTxnHarness Connector** implementations are allowed to perform modifications to the format of the data provided to them if and only if: such modifications are done to support differing characteristics of the underlying transport mechanisms. For example, transporting the data from a big-endian machine to a little-endian machine or from an ASCII environment to an EBCDIC environment will require changes in the data format.

4.2 Driver & System Under Test (SUT) Definitions

The diagram of the functional components of the Test System can be leveraged to provide pictorial definitions of the **Driver**, **SUT**, **Tier A** and **Tier B**.

Figure 4.d - Defined Components of the Test Configuration

- 4.2.1 **The Driver** – is defined to be all hardware and software needed to implement the Driving & Reporting, EGenDriver and up-stream Connector functional components.
- 4.2.2 The use of a **Network** (as defined in Clause 4.1.3) between the **Driver** and **Tier A** is mandatory.
- 4.2.3 **Tier A** – is defined to be all hardware and software needed to implement the down-stream Connector, EGenTxnHarness, **Frame Implementation** and **Database Interface** functional components.
- 4.2.4 **Tier B** – is defined to be all hardware and software needed to implement the **Database Server** functional component. This includes data storage media sufficient to satisfy the initial database population requirements of clause 2.6.1 and the Business **Day** growth requirements of clause 6.6.6.4 and clause 6.6.6.5.
- 4.2.5 **System Under Test (SUT)** – is defined to be the sum of **Tier A** and **Tier B**.
- 4.2.6 **Measured Configuration** - See **System Under Test**.

Comment: It is possible for the **Driver**, **Tier A** and **Tier B** to share implementation resources. For example, the software portion of the **Driver** implementation and the software portion of **Tier A** may both run on the same underlying hardware.

4.3 Example Test Configuration Implementations

- 4.3.1 The following figure shows the physical components that could be assembled to implement a hypothetical test configuration.

Figure 4.e - Sample Component of Physical Test Configuration

- 4.3.2 The next few figures show some valid variations on the above test configuration and some of the valid ways for the **Driver**, **Tier A**, and **Tier B** to share common resources.

Figure 4.f - Separate Driver with Combined Tier A and Tier B

Figure 4.g - Driver and Tier A Combined, Separate Tier B

Figure 4.h - Combined Driver, Tier A and Tier B

4.4 Further Requirements for SUT and Driver Implementations

4.4.1 Restrictions on the Driver

The purpose of this section is to limit the knowledge (or use of the knowledge by the **Driver**) of the SUT, the contents of the database and the transactions. The intent is to encourage **Sponsors** to develop **Driver** implementations independent of the makeup of the **System Under Test** or its underlying database and transactions. The restrictions defined in the following clauses are designed to limit the extent that **Sponsors** can take advantage of the limited nature of TPC-E, the database and transactions.

4.4.1.1 During the **Test Run** the **Sponsor** written code to implement the **Driver** must not:

- make decisions based upon the contents of the database (including **EGenInputFiles**)
- provide information to the **SUT** that results in a performance advantage

4.4.1.2 If customer partitioning in **EGenDriverCE** is used, the configuration must satisfy the requirements of Clause 6.4.2.

4.4.1.3 The **no-peaking-in-the-packet** rule: Data predicated routing (based on the content of the packet) in **EGenDriver Connector** or **EGenTxnHarness Connector** is not allowed.

- 4.4.1.4 The **Sponsor** written code executed between **EGenDriver** (i.e. the following APIs: CESUTInterface, MEESUTInterface, DMSUTInterface) and the mandatory **Network** may not make any decision related to routing, timing, reordering or pacing of that **Transaction** or any other **Transaction** based on that **Transaction's** type or input values.
- Comment:** These restrictions include direct knowledge (e.g., obtained by peeking in the packet) or implied knowledge (e.g., obtained by card counting, message size, etc.).
- 4.4.1.5 Any **Sponsor** written code that sends a market request from the **SUT** to the **Driver** (i.e. SendToMarketInterface) may not make any decisions related to routing, timing, reordering, or pacing of that request or any other request based on that request's input values.
- Comment:** These restrictions include direct knowledge or implied knowledge.
- 4.4.1.6 If routing is done within a **Frame Implementation**, a transaction monitor must perform the routing (see Clause 3.2.1.8). The **Sponsor's** implementation of *SendToMarketFromFrame* interface is not governed by this clause but the implementation still must conform to clause 4.4.1.5.

4.4.2 Disclosure of Network Configuration

The **Test Sponsor** shall describe completely the **Network** configurations of both the tested services and the proposed real (target) services which are being represented.

4.4.3 SUT Implementation Limits on Operator Intervention

Systems must be able to run normal operations for at least a **Business Day** without requiring any operator intervention to sustain the **Reported Throughput**.

Comment: Operator intervention is defined as any activity that requires an operator or an individual to perform a function to enable the **SUT** to continue processing **Transactions**.

4.4.4 Synchronization of Time

All of the systems used for the **Driver** and **SUT** must have system clocks which are synchronized to within a tolerance of 10 seconds across all systems. The synchronization must be verified once before and once after the **Test Run**.

CLAUSE 5 -- EGEN

5.1 Overview

EGen is a TPC provided software package designed to facilitate the implementation of TPC-E. **EGen** provides:

- consistent data generation independent of the underlying environment
- **Transaction** generation and **Frame** flow control management
- project build and makefile templates

This clause covers the constraints and regulations governing the use of **EGen**. For detailed information on **EGen**, what features and functionality it provides and how a **Test Sponsor** is to use those features and functionality see Appendix A.

5.2 EGen Terms

- 5.2.1 **EGen** is a TPC provided software environment that must be used in a **Test Sponsor's** implementation of the TPC-E benchmark. The software environment is logically divided into three packages: **EGenProjectFiles**, **EGenInputFiles**, and **EGenSourceFiles**. The software packages provide functionality to use: **EGenLoader** to generate the data used to populate the database, **EGenDriver** to generate transactional data and **EGenTxnHarness** to control frame invocation.
- 5.2.2 **EGenProjectFiles** is a set of TPC provided files used to facilitate building the **EGen** packages in a **Test Sponsor's** environments.
- 5.2.3 **EGenInputFiles** is a set of TPC provided text files containing rows of tab-separated data, which are used by various **EGen** packages as “raw” material for data generation.
- 5.2.4 **EGenSourceFiles** is the collection of TPC provided C++ source and header files.
- 5.2.5 **EGenLoader** is a binary executable, generated by using the methods described in **EGenProjectFiles** with source code from **EGenSourceFiles**, including any extensions by a **Test Sponsor** (see Clause 5.7.4). When executed, **EGenLoader** uses **EGenInputFiles** to produce a set of data that represents the initial state of the TPC-E database.
- 5.2.6 **EGenDriver** comprises the following parts:
- **EGenDriverCE** provides the core functionality necessary to implement a **Customer Emulator**.
 - **EGenDriverMEE** provides the core functionality necessary to implement a **Market Exchange Emulator**.
 - **EGenDriverDM** provides the core functionality necessary to implement the **Data-Maintenance Generator**.
- 5.2.7 **EGenDriver** provides core transactional functionality (e.g. **Transaction Mix** and input generation) necessary to implement a **Driver**. **EGenTxnHarness** defines a set of interfaces that are used to control the execution of, and communication of inputs and outputs, of **Transactions** and **Frames**.
- 5.2.8 **EGenValidate** is a binary executable, generated by using methods described in **EGenProjectFiles** with source code from **EGenSourceFiles**. When executed, **EGenValidate** uses **Sponsor** provided input to validate that the **Sponsor's Measurement Interval** had compliant Trade-Results per **Load Unit**.

5.2.9 **EGenLogger** logs the initial configuration and any re-configuration of **EGenDriver** and **EGenLoader**, and compares current configuration with the TPC-E prescribed defaults.

5.3 Compliant EGen Versions

5.3.1 The TPC Policies Clause 5.3.1 requires that the version of the specification and EGen must match. The **EGen** version can be determined by calling the GetEGenVersion function provided in EGen/src/EGenVersion.cpp file.

5.3.2 **EGen** is intended to produce correct data. However, it is the **Test Sponsor**'s responsibility to ensure that the random distribution of all data values, inputs and **Transaction Mix** frequencies produced by **EGen** is compliant with all constraints documented in the specification (e.g. **Transaction Mix**, execution rules, population constraints, etc.).

5.3.3 Any existing errors in a compliant version of **EGen**, as provided by the TPC, are deemed to be in compliance with the specification. Therefore, any such errors may not serve as the basis for a compliance challenge.

5.3.4 **EGen** is written in ISO C/C++ based on the following standards:

- ISO/IEC 9899:1999 Programming Language C
- ISO/IEC 14882:2003 Programming Language C++

Failure of a C/C++ compiler to properly compile **EGen** because of the compiler's non-conformance with the above standards does not constitute a bug or error in **EGen**.

5.3.5 Using EGen within a Compliant Driver

As the **EGen** code is written C++, there is the capability for sponsors to extend the TPC-provided classes, while not modifying **EGenSourceFiles** itself. Furthermore, there is the implicit requirement for **Sponsors** to provide their own methods for some classes in order to produce a working **Driver** implementation.

There are two cases which need to be considered:

- Concrete Classes: These classes (and respective methods) are completely defined and implemented within **EGenSourceFiles**
- Virtual Classes: These classes (and respective methods) are completely defined and partially implemented within **EGenSourceFiles**

In order to preserve the integrity of the benchmark, the following requirements are defined:

- Concrete classes must be used as-is. They cannot be sub-classed, overloaded or otherwise modified.
- Virtual classes must be extended by **Sponsors**, via sub-classing and/or implementation of missing methods.

5.3.6 Addressing Errors in EGen

If a **Test Sponsor** must correct an error in **EGen** in order to publish a **Result**, the following steps must be performed:

1. The error must be reported to the TPC, following the method described in clause 5.3.7, no later than the time when the **Result** is submitted.
2. The error and the modification used to correct the error must be **reported** in the **FDR**, as described in clause 9.4.5.1.

3. The modification used to correct the error must be reviewed by a **TPC-Certified Auditor**.

Furthermore, the modification and any consequences of the modification may be used as the basis for a non-compliance challenge.

5.3.7 **Process for Reporting Issues with EGen**

EGen has been tested on a variety of platforms. None-the-less, it is impossible to guarantee that **EGen** is functionally correct in all aspects or will run correctly on all platforms. It is the **Test Sponsor's** responsibility to ensure **EGen** runs correctly in their environment(s).

5.3.7.1 **Portability Issues**

If a **Sponsor** believes there is a portability issue with **EGen**, the **Sponsor** must:

- Document the exact nature of the portability issue.
- Document the exact nature of the proposed fix.
- Contact the TPC Administrator with the above specified documentation (hard or soft copy is acceptable) and clearly state that this is an **EGen** portability issue. The **Sponsor** must provide return contact information (e.g. Name, Address, Phone number, Email).

The TPC will provide an initial response to the **Sponsor** within 7 days of receiving notification of the portability issue. This does not guarantee resolution of the issue within 7 days.

If the TPC approves the request, the **Sponsor** will be contacted with detailed instructions on how to proceed. Possible methods of resolution include:

- The TPC releasing an updated specification and **EGen** update
- The TPC issuing a formal waiver documenting the allowed changes to **EGen**. In the event a waiver is issued and used by the **Sponsor**, certain documentation policies apply (see Clause 9.4.5.1).

If the TPC does not approve the request, the TPC will provide an explanation to the **Sponsor** of why the request was not approved. The TPC **may** also provide an alternative solution that would be deemed acceptable by the TPC.

5.3.7.2 **Other Issues**

For any other issues with **EGen**, the **Sponsor** must:

1. Document the exact nature of the issue.
2. Document the exact nature of the proposed fix.
3. Contact the TPC Administrator with the above specified documentation (hard or soft copy is acceptable) and clearly state that this is an **EGen** issue not related to portability. The **Sponsor** must provide return contact information (e.g. Name, Address, Phone number, Email).

5.3.8 **Submitting EGen Enhancement Suggestions**

As a result of using **EGen**, **Test Sponsors** may have suggestions for enhancements. To submit a suggestion the **Sponsor** must:

1. Document the exact nature of the proposed enhancement
2. Document any proposed implementation for the enhancement
3. Contact the TPC Administrator with the above specified documentation (hard or soft copy is acceptable) and clearly state that this is an **EGen** enhancement suggestion. The **Sponsor** must provide return contact information (e.g. Name, Address, Phone number, Email).

The TPC does not guarantee acceptance of any submitted suggestion. However, all constructive suggestions will be reviewed by the TPC, and a response will be provided to the **Test Sponsor**.

5.4 EGenProjectFiles

The **EGenProjectFiles** provided by the TPC are meant to be used as a template for **Test Sponsors** to develop their **EGen** environments. Use of **EGenProjectFiles** is optional.

5.5 EGenInputFiles

Modification of **EGenInputFiles** provided by the TPC is not permitted.

5.6 EGenSourceFiles

Modification of **EGenSourceFiles** provided by the TPC is not allowed, except as permitted by clause 5.3.

5.7 EGenLoader

- 5.7.1 The data for a compliant TPC-E database must be generated by **EGenLoader**. The version of **EGenLoader** used must be compliant with the version of the specification the **Result** is being published under, as listed in clause 5.3.
- 5.7.2 It is presumed that **EGenLoader** produces the correct number of rows for each TPC-E table. However due to the random nature of the data generated by **EGenLoader**, the data may not be compliant with Clause 2 of this specification. In that event the test database is considered invalid.
- 5.7.3 If **EGenLoader** generates an empty string, an empty string should be loaded in the database.
- 5.7.4 If the **Test Sponsor** extends the loading interface of **EGenLoader** (as described in Appendix A.6.6), all extension code must be reviewed by a **TPC-Certified Auditor**. The use of and audit of extension code must be **reported** in the **Report**. The extension code must be **reported** in the **Supporting Files**.

Comment: The intent of this clause is to ensure that all data generated by **EGenLoader** is not modified, other than to support formatting issues of database data types and sorting of the data, while still allowing **Sponsors** the ability to customize **EGenLoader** to specify how the data gets loaded into the database.

5.8 EGenDriver

- 5.8.1 All **EGenLogger** output must be **reported** in the **Supporting Files**. If any **EGenLogger** output contains "NO", indicating the correct default values were not used, the benchmark **Result** is not compliant.
- 5.8.2 **Sponsors** must use a constructor for each object class (CCE, CMEE, or CDM) that does not have RNGSEED parameter(s).
- 5.8.3 **Sponsors** must ensure that the values provided for the UniqueID parameters to the constructors for each object group (CCE, CMEE or CDM) are unique within each object group.
- 5.8.4 The **Transaction** inputs are generated by the **EGenDriverCE**, **EGenDriverMEE** and **EGenDriverDM** classes. Each **CE**, **MEE** and **DM** instance must be instantiated using consistent values for some global inputs, and must use the same values used by all **EGenLoader** instances during the initial data generation.

The contents of **EGenInputFiles** used by all **EGenLoader** instances (when building the database) and by all **CE**, **MEE** and **DM** instances (when running against the database) must be the **EGenInputFiles** for the version of TPC-E that is used in the benchmark publication.

5.8.5 **EGenDriverCE**

5.8.5.1 A compliant **CE** implementation must use **EGenDriverCE**.

5.8.5.2 If customer partitioning in **EGenDriverCE** is used, the configuration must satisfy the requirements of Clause 6.4.2.

5.8.6 **EGenDriverMEE**

5.8.6.1 A compliant **MEE** implementation must use **EGenDriverMEE**.

5.8.7 **EGenDriverDM**

5.8.7.1 A compliant **Data-Maintenance Generator** must use **EGenDriverDM**.

5.8.7.2 One, and only one, instance of the **Data-Maintenance Generator** is required and allowed during a **Test Run**.

5.9 **EGenTxnHarness**

5.9.1 A compliant TPC-E implementation must use **EGenTxnHarness**.

5.10 **EGenValidate**

5.10.1 A compliant TPC-E implementation must use **EGenValidate** to verify a **Measurement Interval** has compliant Trade-Results per **Load Unit**.

CLAUSE 6 -- EXECUTION RULES & METRICS

6.1 Introduction

This clause defines the execution rules and the methods for calculating the benchmark metric.

6.1.1 Definition of Terms

- 6.1.1.1 The term **Reported** refers to an item that is part of the **FDR** (see Clause 9 -- for detailed requirements).
- 6.1.1.2 The term **Valid Transaction** refers to any **Transaction** for which input data has been sent in full by the **Driver**, whose processing has been successfully completed on the **SUT** and whose correct output data has been received in full by the **Driver**.

Comment 1: **Transaction** errors are not allowed during the **Test Run**. A **Transaction** that never completes is considered an error.

Comment 2: A Trade-Order **Transaction** that requires a rollback that runs successfully and produces the correct output is considered a **Valid Transaction**.

Comment 3: A **Transaction** that aborts and is retried by the **SUT** and ultimately completes successfully and produces the correct output is not an error. A **Transaction** may not be retried by the **Driver**.

6.2 Driver Implementation Architectures

Although the use of **EGenDriver** code is mandatory when implementing a compliant **Driver** (see Clause 5.2.1), there is still a fair degree of flexibility in the overall **Driver** architecture. The variations in architecture that result from this flexibility have an impact on understanding and interpreting the benchmark execution rules. Therefore, this section provides an overview of key architectural variations. These models are examples only and do not represent an exhaustive list. For simplicity, the focus will be on the **CE**, but the same principles apply to the **MEE** as well.

6.2.1 The Simple CE

In its simplest form, the **CE** has:

- A single thread of execution
- A single instance of the CCE class (i.e. an **EGenDriverCE** of size 1)
- A single blocking **Network** connection to the **SUT**

During the **Test Run**, the **CE** cycles through a process of calling from **Sponsor** provided code into **EGenDriverCE** code to generate the next **Transaction** type and the necessary input data, calling from the **EGenDriverCE** code into **Sponsor** provided code to record the **Transaction**'s start time, send the input data to the **SUT**, wait for the **Transaction** to execute, receive in the output data from the **SUT**, record the **Transaction**'s end time, and then finally return from the **Sponsor** code back through the **EGenDriverCE** code back to the initial **Sponsor** code. At this point, the **Sponsor** may inject an optional **Pacing Delay** before repeating the whole process. The following diagram captures this pictorially.

Figure 6.a - The Simple CE

6.2.2 The Replicated CE

There are limits to the amount of throughput the Simple CE can generate. So replication of the Simple CE is permitted. This allows multiple copies of the Simple CE to generate the necessary **Nominal Throughput** for any size database. Since there will be multiple instances of the CCE class, this is equivalent to an **EGenDriverCE** of size N (where N is the number of CCE instances).

The mandatory use of **EGenDriverCE**'s auto-RNG seeding (see Clause 5.8.2) means that these will not be exactly identical copies of the Simple CE. Each copy will start off at a different point in the RNG stream. The following diagram shows the Replicated CE.

Figure 6.b - The Replicated CE

6.2.3 The Asynchronous CE

Flexibility can be added into a **Sponsor's CE** environment by introducing asynchronicity. There are two places where this can be done.

- Between the CESUTInterface code and the **EGenDriver Connector** code
- Between the **EGenDriver Connector** code and the **EGenTxnHarness Connector** code

The following sections describe these scenarios in more detail.

6.2.3.1 Asynchronous Transaction Generator

Asynchronicity between the CESUTInterface code and the **EGenDriver Connector** code is achieved by using some form of a queue. This allows one thread of execution to act as a **Transaction** generator for one or more other **Driver** threads of execution. In this arrangement, the **Transaction** generator thread makes use of **EGenDriverCE** code to generate the **Transactions** and their associated inputs. This information is then placed on a queue. Then a pool of one or more **Driver** threads of execution can dequeue the pre-generated **Transactions** and send them to the **SUT** for processing. The following diagram shows the Asynchronous Transaction Generator.

Figure 6.c – Asynchronous Transaction Generator

When using the Asynchronous Transaction Generator architecture for **Customer Initiated** and **Brokerage Initiated** transactions, the following constraints must be met.

- Each generator must have a unique queue and there must be one and only one queue per generator.
- Each generator's queue must be FIFO.
- **EGenDriver Connector** threads of execution must always dequeue from the same queue.

Comment: Although not mandatory, the Asynchronous Transaction Generator architecture is anticipated to be used with the CMEE class when implementing a **Market Exchange Emulator**. Note that Clause 4.4.1.4 places constraints on the implementation. For example, while there is no restriction on the number of queues the MEE generator may have, Clause 4.4.1.4 requires the queues to be FIFO and prohibits them from being transaction-type based (this would be considered implicit routing).

6.2.3.2 Non-Blocking Driver Threads of Execution

There is a mandatory **Network** connection between the **EGenDriver Connector** code and the **EGenTxnHarness Connector** code (see Clause 4.1.3.8). The **Sponsor** can choose whether blocking or non-blocking **Network** connections are used. The use of non-blocking **Network** connections introduces asynchronicity between the **Driver** and the **SUT**. This allows a **Driver** thread of execution to submit a new **Transaction** to the **SUT** prior to the completion of other **Transactions** previously submitted by the same thread. The completion of **Transactions** may be handled by the initiating thread or by a completely different thread. The following diagram shows the Non-Blocking Driver.

Figure 6.d – Non-Blocking Driver Threads of Execution

6.2.4 Combinations

Combinations of some or all of the previous architectural variants are possible. For example, an Asynchronous Transaction Generator could be used with Non-Blocking Driver Threads of Execution. This architecture could then be replicated multiple times.

6.2.5 Driver Reporting Requirements

The number of EGenDriverMEE and EGenDriverCE instances used in the benchmark must be reported in the Report.

6.3 Transaction Mix

The TPC-E workload is made up of a set of **Transactions** acting against a database following a specified **Transaction Mix**. During the **Test Run**, the CCE code controls the generation of **Brokerage Initiated** and **Customer Initiated Transaction** types via a card deck methodology designed to satisfy the specified mix (see CETxnMixGenerator.cpp). The **Market Triggered Transactions** are not generated by the CE but arise from asynchronous actions in the MEE.

Since deviations from the specified mix are still possible, it is the **Test Sponsor's** responsibility to make sure that the following criteria were indeed met for the **Measurement Interval** in order for the **Measurement Interval** to be valid. For the purposes of verifying that these criteria are met any and all **Valid Transactions** whose sT_n and eT_n are both within the **Measurement Interval** are to be counted.

6.3.1

Mix Requirements

The following table shows the target mix percentage. The **Test Sponsor** must show that the actual percentage obtained for each **Transaction** type over the entire **Measurement Interval** is within the specified Required Range.

Transaction	Target Pct	Required Range	Comment
Broker-Volume	4.9%	4.875% - 4.925%	
Customer-Position	13%	12.935% - 13.065%	
Market-Feed	1%	0.995% - 1.005%	Each Market-Feed contains entries for 10 completed Trade-Results.
Market-Watch	18%	17.910% - 18.090%	
Security-Detail	14%	13.930% - 14.070%	
Trade-Lookup	8%	7.960% - 8.040%	
Trade-Order	10.1%	10.049% - 10.151%	~1% of Trade Orders rollback (see Clause 6.4.1, rollback is 1 out of each 101 Trade Orders.). 99% of 10.1% is the 10% for Trade Result.
Trade-Result	10%	9.950% - 10.050%	There is one Trade-Result per Trade-Order completed by the MEE, but ~1% of Trade-Order Transactions rollback at time of initial processing.
Trade-Status	19%	18.905% - 19.095%	
Trade-Update	2%	1.990% - 2.010%	
Total	100%		

Comment: The number of completed Trade-Results is one per non-aborted Trade-Order. However, pending limit orders are delayed until their trigger price is reached. Therefore mix percentages may vary over short periods of time. Similarly, the number of Market-Feed **Transactions** is controlled by the CMEE code to be one for every ten Trade-Results generated. Therefore the mix frequencies may vary over short periods of time. In general though, they will closely follow 1/10th the mix percentage of Trade-Result.

6.3.2

Required Precision for Mix Percentage Reporting

The **Transaction Mix** percentages must be **reported** to the same precision as shown in the Required Range in the table in Clause 6.3.1.

Computing the mix frequencies actually obtained during the **Measurement Interval** must be done with at least four decimal places and must be rounded to the nearest three decimal places when **reported**. For example, 7.2344 must be **reported** as 7.234 and 7.2345 must be **reported** as 7.235

6.3.3

Data-Maintenance

A single Data-Maintenance **Transaction** must be invoked every sixty seconds. The actual interval between the executions of two consecutive **Transactions** must be no less than 58 seconds and no more than 62 seconds. Each Data-Maintenance **Transaction** must successfully complete in 55 seconds or less.

6.3.4

Trade-Cleanup

The special Trade-Cleanup **Transaction** is not part of the **Transaction Mix**. There are no **Response Time** criteria for the Trade-Cleanup **Transaction**, except that the **Transaction** must be invoked and finish before any other type of **Transaction** can be executed.

6.4 Transaction Parameters

Each **Transaction** type has variable inputs. Some of the **Transactions** have specified percentages (see DriverParamSettings.h) for the possible values of these inputs. During the **Test Run**, the **EGenDriver** code controls the generation of the values for these inputs using a random number generator in a manner designed to satisfy the specified percentage (see CETxnInputGenerator.cpp). However since deviations from the specified percentage are still possible, it is the **Test Sponsor's** responsibility to make sure that the following criteria were indeed met for the **Measurement Interval** in order for the **Measurement Interval** to be valid. For the purposes of verifying that these criteria are met, inputs for any and all **Valid Transactions**, whose **sT_n** and **eT_n** are both within the **Measurement Interval** and are to be counted.

6.4.1 Input Value Mix Requirements

The following table shows the target input value percentages. The **Test Sponsor** must show that the actual percentage obtained for each input type over the entire **Measurement Interval** is within the specified Required Range.

Input Parameter	Value	Target Pct	Required Range
Customer-Position			
by_tax_id	1	50%	48% to 52%
get_history	1	50%	48% to 52%
Market-Watch			
Securities chosen by	Watch list	60%	57% to 63%
	Account ID	35%	33% to 37%
	Industry	5%	4.5% to 5.5%
Security-Detail			
access_lob	1	1%	0.9% to 1.1%
Trade-Lookup			
frame_to_execute	1	30%	28.5% to 31.5%
	2	30%	28.5% to 31.5%
	3	30%	28.5% to 31.5%
	4	10%	9.5% to 10.5%
Trade-Order			
Transactions requested by a third party		10%	9.5% to 10.5%
Security chosen by company name and issue		40%	38% to 42%
type_is_margin	1	8%	7.5% to 8.5%
roll_it_back	1	~1%	0.94% to 1.04% (*)
is_lifo	1	35%	33% to 37%
trade_qty	100	25%	24% to 26%
	200	25%	24% to 26%
	400	25%	24% to 26%
	800	25%	24% to 26%
trade_type	TMB	30%	29.7% to 30.3%

	TMS	30%	29.7% to 30.3%
	TLB	20%	19.8% to 20.2%
	TLS	10%	9.9% to 10.1%
	TSL	10%	9.9% to 10.1%
Trade-Update			
frame_to_execute	1	33%	31% to 35%
	2	33%	31% to 35%
	3	34%	32% to 36%

(*) **Comment:** The ratio of aborted trades to completed trades is 1/100 or 1%, so the ratio of aborted trades to all trades is 1/101 or only ~1%. The actual expected percentage is closer to 0.99%, which is why the range of acceptable values is 0.94% to 1.04% (not 0.95% to 1.05%), since this range is centered on the expected 0.99% value.

6.4.2 Customer Partitioning

More than one instance of the **CE** may be executing simultaneously. The **CE** instances may be partitioned by **C_ID** (customer identifier).

6.4.2.1 Configuration Requirements

- The **C_ID** sub-range for a given **EGenDriverCE** instance must be a contiguous set of **C_IDs**.
- The minimum **C_ID** of the sub-range must be the starting **C_ID** for a **Load Unit**.
- The minimum size of the sub-range of **C_IDs** is 5,000.
- The size of the sub-range of **C_IDs** must be an integral number of the **Load Unit** size.
- The size of the sub-range of **C_IDs** does not have to be the same for each **CE** instance.

In addition, when **C_ID** partitioning is used, the **EGenDriverCE** code will ensure that:

- **C_ID** values are chosen from the entire **Configured Customer** range 50% of the time.
- **C_ID** values are chosen from the provided partitioned customer sub-range 50% of the time.

Comment: For example, assume a database with 60,000 **Configured Customers**, four (4) **CE** instances. The first two instances will use 20,000 customers and the remaining two instances will use 10,000 customers.

- Instance 1 would be configured to use **iMyStartingCustomerId** of 1, **iMyCustomerCount** of 20,000, and **iPartitionPercent** of 50%.
- Instance 2 would be configured to use **iMyStartingCustomerId** of 20,001, **iMyCustomerCount** of 20,000, and **iPartitionPercent** of 50%.
- Instance 3 would be configured to use **iMyStartingCustomerId** of 40,001, **iMyCustomerCount** of 10,000, and **iPartitionPercent** of 50%.
- Instance 4 would be configured to use **iMyStartingCustomerId** of 50,001, **iMyCustomerCount** of 10,000, and **iPartitionPercent** of 50%.

6.4.2.2 Runtime Validation Test

At initialization time for each **CE** instance, record the partition's starting customer and partition count of customers supported by this partitioned **CE** instance. From this information, derive a unique Partition Range number "r". All **CE** instances with the same starting customer and partition count must be assigned the same "r".

During a **Test Run**, for each **CE** instance and each started **CE Transaction** (one whose sT_n time has been assigned), the **Driver** needs to record enough information to determine after a **Test Run** the number of **CE Transactions** started from each **CE** instance during each 30-second time interval.

After a **Test Run**, when the location and duration of the **Measurement Interval** has been determined, process the recorded **CE** sT_n information and perform the following calculations for each non-overlapping 30-second time interval “ t ” wholly within the **Measurement Interval**:

1. For all **CE** instances in each Partition Range “ r ” within each 30-second time interval “ t ”, count the number of **CE Transactions** started (sT_n assigned). Call this count $C_{r,t}$.
2. Divide $C_{r,t}$ by the number of **Load Units** (LUs) in Partition Range “ r ”. Call this normalized value $N_{r,t}$.
3. Compute the “average **CE** driving rate per **Load Unit** across the entire database” A_t by summing all $C_{r,t}$ and dividing by the total number of **Load Units** in the database.
4. Count the number of $N_{r,t}$ values that do not satisfy $A_t * 0.95 \leq N_{r,t} \leq A_t * 1.05$. Call this count D_t .
5. Call the total number of Partition Ranges R . If $D_t / R > 0.05$, then consider time interval “ t ” to have failed the test and set F_t to 1; otherwise, set F_t to 0.

Sum the F_t across all values of “ t ”. Call this value S .

Call the number of 30-second time intervals in the **Measurement Interval** T .

The **Measurement Interval** must meet the following requirement:

- $S / T \leq 0.05$.

6.5 Response Time and Pacing Delays

6.5.1 Response Time

6.5.1.1 The **Response Time** (RT) is defined by:

$$RT_n = eT_n - sT_n$$

where:

sT_n and eT_n are measured at the **Driver**;

sT_n = time measured before the first byte of input data of the **Transaction** is sent by the **Driver** to the **SUT**; and

eT_n = time measured after the last byte of output data from the **Transaction** is received by the **Driver** from the **SUT**.

Comment: The resolution of the time stamps used for measuring **Response Time** **must** be at least 0.01 seconds.

6.5.1.2 During the **Measurement Interval**, at least 90% of each **Transaction** type must have a **Response Time** less than or equal to the constraint specified in the table below.

Transaction	90% Response Time Constraint
Broker-Volume	3 sec.
Customer-Position	3 sec.

Market-Feed	2 sec.
Market-Watch	3 sec.
Security-Detail	3 sec.
Trade-Lookup	3 sec.
Trade-Order	2 sec.
Trade-Result	2 sec.
Trade-Status	1 sec.
Trade-Update	3 sec.

- 6.5.1.3 The following diagram illustrates where **Response Time**'s are measured for each type of **Transaction**. Time stamps are taken on the **Driver**.

Figure 6.e - Measuring Response Time

- 6.5.1.4 Over the **Measurement Interval**, the average **Response Time** for each type of **Transaction** that is part of the **Transaction Mix** must not be longer than the 90th percentile **Response Time** for that **Transaction**.
- 6.5.1.5 The **Data-Maintenance Transaction** does not have average and 90th percentile **Response Time** requirements. Instead, each **Data-Maintenance Transaction** must successfully complete in 55 seconds or less.
- 6.5.1.6 There are no **Response Time** criteria for the **Trade-Cleanup Transaction**. It must complete successfully before a **Test Run** can start and thus before any other type of **Transaction** can be executed.

6.5.2 Dispatch Time and Pacing Delay

6.5.2.1 Each **EGenDriverCE** thread of execution calling the **EGenDriver Connector** interface creates a sequence of **Transactions**, defined chronologically as { T1, T2, ... Tn }. Within each sequence, the **Dispatch Time** of Transaction n is defined as follows:

- for the Non-Blocking Driver Thread architecture (see 6.2.3.2)
 - For n=1: $DT_n = 0$
 - For n>1: $DT_n = (sT_n - sT_{n-1})$
- for all other architectures in Clause 6.2
 - For n=1: $DT_n = 0$
 - For n>1: $DT_n = (sT_n - eT_{n-1})$
- Where sT_n and eT_n are defined in Clause 6.5.1.1

6.5.2.2 The **Dispatch Time** must be less than (or equal) to 1 second during the **Measurement Interval**.

6.5.2.3 **Pacing Delay** is defined as the total time injected into the **Dispatch Time** (DT_n) that is intended to decrease the rate at which **Transactions** are submitted to the **SUT**.

The **Pacing Delay** can be adjusted by the **Test Sponsor** to control the rate at which **Transactions** are submitted to the **SUT**. The **Pacing Delay** may be adjusted to produce a compliant measured tpsE in relation to the configured database scaling (see Clause 6.7.1).

Comment: The value of the **Pacing Delay** may vary during **Steady State** and may vary between different instances of the CCE class.

6.6 Test Run

6.6.1 Definition of Terms

6.6.1.1 The term **Test Run** refers to the entire period of time during which **Drivers** submit and the **SUT** completes **Transactions** other than Trade-Cleanup. A **Test Run** is subdivided into the three consecutive and non-overlapping time periods of **Ramp-up**, **Steady State** and **Ramp-down**.

6.6.1.2 The term **Ramp-up** refers to the period of time from the start of the **Test Run** to the start of **Steady State**.

6.6.1.3 The term **Steady State** refers to the period of time from the end of the **Ramp-up** to the start of the **Ramp-down**.

6.6.1.4 The term **Ramp-down** refers to the period of time from the end of **Steady State** to the end of the **Test Run**.

6.6.1.5 The term **Measurement Interval** refers to the period of time during **Steady State** chosen by the **Test Sponsor** to compute the **Reported Throughput**.

6.6.1.6 The term **Business Day** refers to a period of eight hours of transaction processing activity.

6.6.1.7 The performance of the **SUT** is defined to be **Sustainable** if the performance over a given period of time (computed as the average throughput over that time) shows no significant variations.

6.6.2 Database Content

6.6.2.1 Prior to the first **Test Run**, the initial database must satisfy Clause 2.6.1. Prior to any **Test Run**, the database must satisfy Clause 2.4 and Clause 2.6.2.

Comment: Clause 2.6.2 defines cardinality changes as **Transactions** are executed against the database. If no **Transactions** have been executed, then initial cardinalities of Clause 2.6.1 apply.

6.6.2.2 At the start of a **Test Run** the database must not contain any pending or submitted trades. This must be accomplished either by using a database in its initially populated state or by executing the Trade-Cleanup **Transaction** prior to the start of the **Test Run**.

6.6.2.3 The only changes (unless otherwise directed by an **Auditor**) that can be made to the content of the TPC-E database tables between the initial population and a valid **Test Run** must be performed by the running of **Valid Transactions**, as defined in this specification.

6.6.3 Sustainable Performance

6.6.3.1 During **Steady State** the throughput of the **SUT** must be **Sustainable** for the remainder of a **Business Day** started at the beginning of the **Steady State**.

6.6.3.2 Some aspects of the benchmark implementation can result in rather insignificant but frequent variations in throughput when computed over somewhat shorter periods of time. To meet the **Sustainable** throughput requirement, the cumulative effect of these variations over one **Business Day** must not exceed 2% of the **Reported Throughput**.

Comment: This requirement is met when the throughput computed over any period of one hour, sliding over the **Steady State** by increments of ten minutes, varies from the **Reported Throughput** by no more than 2%.

6.6.3.3 Some aspects of the benchmark implementation can result in rather significant but sporadic variations in throughput when computed over some much shorter periods of time. To meet the **Sustainable** throughput requirement, the cumulative effect of these variations over one **Business Day** must not exceed 20% of the **Reported Throughput**.

Comment: This requirement is met when the throughput level computed over any period of ten minutes, sliding over the **Steady State** by increments one minute, varies from the **Reported Throughput** by no more than 20%.

6.6.3.4 Any resources or components required by the **SUT** to meet the **Sustainable** performance requirements must be configured at all time during the **Test Run**.

Comment 1: An example of a non-compliant configuration would be one where the database log file is assigned to a heterogeneous device starting with a high performance drive and overflowing on a slower drive, achieving better performance during the first few hours of **Steady State** than during the remainder of the **Business Day**.

Comment 2: An example of a compliant implementation would be one where the database log file is assigned to a homogeneous device large enough to hold the log over a complete checkpoint cycle and configured to be reused over each subsequent checkpoint cycles, achieving a **Sustainable** throughput during **Steady State** and for the remainder of the **Business Day**.

6.6.4 Steady State

- 6.6.4.1 All work or events that must be performed at regular intervals by the SUT during **Steady State** must occur in full at least once between the start of **Steady State** and the start of the **Measurement Interval**. (For example see Clauses 6.6.5.3 and 6.3.3).
- 6.6.4.2 The duration of **Steady State** is set by the **Sponsor** and must be sufficient to:
- Include a compliant **Measurement Interval**,
 - Provide sufficient evidence, at the discretion of the **Auditor**, that the **Sustainable** performance requirement is met,

6.6.5 Measurement Interval

- 6.6.5.1 The **Measurement Interval** must be a minimum of two hours and must occur entirely during **Steady State**.
- 6.6.5.2 For the purposes of calculating **reported Transaction** statistics all **Transactions** and only those **Transactions** whose sT_n and eT_n are within the **Measurement Interval** are used.
- 6.6.5.3 During the **Measurement Interval**, the database contents (excluding the transaction log) stored on **Durable Media** cannot be more than 15 minutes older than any **Committed** state of the database.
- Comment:** This may mean that **Database Management Systems** implementing traditional checkpoint algorithms may need to perform checkpoints twice as frequently (i.e. every 7.5 minutes) in order to guarantee that the 15 minute requirement is met.
- 6.6.5.4 All threads of execution that perform **CE Transactions** during the **Measurement Interval** must:
- Perform at least one **Transaction** prior to the start of the **Measurement Interval**
 - Perform at least one **Transaction** after the end of the **Measurement Interval**
- Creating, starting, stopping, deleting threads of execution that perform **CE Transactions** is not permitted during the **Measurement Interval**.

6.6.6 Database Growth

- 6.6.6.1 The resources or components configured on the SUT to support executing the **Transaction Mix** at the **Reported Throughput** during the period of required **Sustainable** performance (see Clause 6.6.3) must allow for the resulting increase in the size of the **DBMS** data files (referred to as **Data Growth**) and the **DBMS** log files (referred to as **Log Growth**).
- 6.6.6.2 **Initial Database Size** is measured after the database is initially loaded with the data generated by **EGenLoader**. **Initial Database Size** is any space allocated to the test database which is used to store a database entity (e.g. a row, an index, **Database Metadata**), or used as formatting overhead by the data manager.
- 6.6.6.3 The total storage space in the **DBMS** data files can be decomposed into the following:
- **Free Space**, which includes any space allocated to the test database and available for future use. It includes all database storage space not already used to store a database entity (e.g., a row, an index, **Database Metadata**) or not already used as formatting overhead by the **DBMS**.

- **Growing Space**, which includes any space used to store existing rows from the **Growing Tables** and their associated **User-Defined Objects**. It includes all database storage space that is added to the test database as a result of inserting a new row in the **Growing Tables**, such as row data, index data and other overheads such as index overhead, page overhead, block overhead, and table overhead.
- **Fixed Space**, which includes any other space used to store static information and indices. It includes all database storage space allocated to the test database which does not qualify as either **Free Space** or **Growing Space**.

Comment: While cardinality does not change for non-**Growing Tables**, it is possible that some **Fixed Space** storage could increase for other reasons. If the computed increase for the **Business Day** for any such object would be greater than the 5% cardinality increase already imposed on non-**Growing Table** objects by Clause 2.3.9, then the larger computed storage increase must be used instead of the 5% increase.

6.6.6.4 The **Data Growth** must be computed based on the **Test Run** as follows:

- The measured **Growing Space** before the **Test Run** is recorded.
- The **Test Run** is executed in full.
- The measured **Growing Space** after the **Test Run** is recorded.
- The *Data-Space-per-Trade-Result* is computed as the total increase in **Growing Space** over the **Test Run** divided by the total number of Trade-Result **Transactions** completed during the **Test Run**.
- The **Data Growth** is computed by multiplying the *Data-Space-per-Trade-Result* by the **Reported Throughput** and by the duration of the required **Sustainable** performance:
 - $\text{Data Growth} = \text{Data-Space-per-Trade-Result} * \text{tpsE} * \text{Business Day duration in seconds}$

6.6.6.5 The **Log Growth** must be computed based on the **Test Run** as follows:

- The space used in the database log file before the **Test Run** is recorded.
- The **Test Run** is executed in full.
- The space used in the database log file after the **Test Run** is recorded.
- The total increase in the used for database log space is divided by the number of Trade-Result **Transactions** completed during the **Test Run**, giving the *Log-Space-per-Trade-Result*.
- The *Log-Space-per-Trade-Result* is multiplied by the **Reported Throughput** and by the duration of the required **Sustainable** performance to compute the **Log Growth** as follows:
 - $\text{Log Growth} = \text{Log-Space-per-Trade-Result} * \text{tpsE} * \text{Business Day duration in seconds}$

6.6.6.6 **60-Day Data Space**

Storage must be priced for sufficient space to store and maintain the data and **User-Defined Objects** generated during a period of 60 **Business Days** at the **Reported Throughput** called the **60-Day Period**.

The **60-Day Space** must be computed as:

$$\text{60-Day Space} = \text{Initial Database Size} + (60 * \text{Data Growth})$$

The calculation of **Data Growth** is described in clause 6.6.6.4.

6.6.7 **Continuous Operation Requirement**

Within the **Measured Configuration**, there must be sufficient **On-Line** storage to support:

- The initial database population (see Clause 2.6) and all **User-Defined Objects** present during the **Test Run**.

- An additional **Business Day's Data Growth** and **Log Growth** at the **reported tpsE**. The methods to calculate the **Data Growth** and the **Log Growth** are described in Clauses 6.6.6.3 and 6.6.6.5.

Comment: The requirement to support a **Business Day** of recovery log data can be met with storage on any **Durable Media** if all data required for recovery from failures listed in Clause 7.5 are **On-Line** and meet the **Sustainable** performance requirements of Clause 6.6.3.

6.6.8 Performance & Database Size

- 6.6.8.1 To keep throughput proportional to database size, the **Measured Throughput** must be within a certain range of performance based on the database size.
- 6.6.8.2 The **Nominal Throughput** of the TPC-E benchmark is defined to be 2.00 **Transactions-Per-Second-E** (tpsE) for every 1000 customer rows in the **Configured Customers**.
- 6.6.8.3 Another way of expressing the **Nominal Throughput** is by using a **Scale Factor**. The **Scale Factor** is the number of required customer rows per single **Transactions-Per-Second-E** (tpsE). The **Scale Factor** for **Nominal Throughput** is 500.
- 6.6.8.4 The **Measured Throughput** is computed as the total number of **Valid Trade-Result Transactions** within the **Measurement Interval** divided by the duration of the **Measurement Interval** in seconds.
- 6.6.8.5 The number of **Load Units** configured must be equal to the number of **Load Units** actually accessed during the **Test Run**.

6.7 Required Reporting

6.7.1 Reported Throughput

- 6.7.1.1 The **Performance Metric reported** by TPC-E is the **Reported Throughput**. The name of the metric used for the **Reported Throughput** of the SUT is **tpsE**. The value of this metric is based on the **Measured Throughput** and is bound by the **limits defined** in Clause 6.7.1.2.
- 6.7.1.2 If the **Measured Throughput** is between 80% and 100% of the **Nominal Throughput**, then the **Reported Throughput** is set to the **Measured Throughput**. Otherwise, if **Measured Throughput** exceeds the **Nominal Throughput**, but not by more than 2%, the measurement may be used, but the **Reported Throughput** must be set to the **Nominal Throughput**. As a result, the **Measured Throughput** can be as much as 2% greater than the **Reported Throughput**. If the **Measured Throughput** is not within these bounds, then the measurement is invalid and may not be **reported**.

Comment 1: For example, for a database size of 5000 customers, the nominal performance is 10.00 tpsE. A measurement run with throughput between 10.00 tpsE and 10.20 tpsE would be **reported** as 10.00 tpsE. A measurement run with throughput between 8.00 tpsE and 10.00 tpsE would be **reported** as that. A measurement run with throughput lower than 8.00 tpsE, or higher than 10.20 tpsE, is invalid for the database size and must not be **reported**.

Comment 2: To increase the level of throughput that can be **reported**, the number of **Configured Customers** in the database must be increased. To decrease the level of throughput that can be **reported**, the number of **Configured Customers** in the database must be decreased. Either of these two actions requires building a new database.

6.7.1.3 The **Reported Throughput** must be measured, rather than interpolated or extrapolated, and rounded down to the nearest two decimal places. For example, suppose 105.748 tpsE is measured during a **Measurement Interval** for which all 90% **Response Time** constraints are met and 117.572 tpsE is measured during a **Measurement Interval** for which some 90% **Response Time** constraints are exceeded. Then the **Reported Throughput** is 105.74 tpsE rather than 105.75 or some interpolated value between 105.748 and 117.572.

6.7.2 Test Run Graph

A graph of the one-minute average tpsE versus elapsed wall clock time measured in minutes must be reported for the entire **Test Run**. The x-axis represents the elapsed time from the **Test Run** start. The y-axis represents the one-minute average throughput in tpsE (computed as the total number of Trade-Result Transactions that complete within each one-minute interval divided by 60). A plot interval size of 1 minute must be used. The **Ramp-up**, **Steady State**, **Measurement Interval**, and **Ramp-down** must be identified on the graph. The **Test Run Graph** must be reported in the **Report**.

Figure 6.f - Example of the Measured Throughput versus Elapsed Time Graph

6.7.3 Primary Metrics

6.7.3.1 To be compliant with the TPC-E standard and the TPC's Fair Use Policies and Guidelines, all public references to TPC-E **Results** for a configuration must include the following components which will be known as the **Primary Metrics**.

- The TPC-E **Reported Throughput** as expressed in tpsE. This is known as the **Performance Metric**.
- The TPC-E total 3-year pricing divided by the **Reported Throughput** is price/tpsE. This is also known as the **Price/Performance Metric** (See Clause 8 --).
- The date when all products necessary to achieve the stated performance will be available (stated as a single date on the **Executive Summary Statement**). This is known as the **Availability Date** (See Clause 9.2.1.1).
- When the optional TPC-Energy standard is used, the additional primary metric, expressed as watts/tpsE, must be reported. In addition, the requirements of the TPC-Energy Specification, located at [www\(tpc.org](http://www(tpc.org)), must be met.

6.7.4 EGenValidate Results

- 6.7.4.1 Each **Load Unit** must do approximately the same number of Trade-Results during the **Measurement Interval**. This requirement must be demonstrated by passing the **EGenValidate** test and providing these results in the **Supporting Files**. **EGenValidate** is TPC provided code. A **Sponsor** must generate the **EGenValidate** binary executable for their environment.
- 6.7.4.2 When the **Sponsor** runs **EGenValidate** they must provide the following inputs:-
- number of **Configured Customers**
 - the standard deviation of the number of Trade-Results performed for each **Load Unit** during the **Measurement Interval** (see Clause 6.6.5.2)

$$\text{standard deviation} = \sqrt{\frac{\sum (\bar{n} - n_i)^2}{(\#LU - 1)}}$$

where n_i = the number of Trade-Results completed for Load Unit i during the Measurement Interval

The precision required for the standard deviation is three decimal digits to the right of the decimal point, rounded up if necessary.

- the number of seconds in the **Measurement Interval**
- the actual tpsE rate recorded during the **Measurement Interval**

6.7.4.3 EGenValidate does the following:-

1. Reads the input values.
2. Uses **EGen** code to simulate up to 10,000 runs on a TPC-E database for that number of **Configured Customers**. The program calculates the average number and standard deviation of Trade-Results per **Load Unit** during the **Measurement Interval**.
3. Prints out "Passed!" if the maximum calculated standard deviation across the 10,000 simulated runs is larger than or equal to the standard deviation for the **Measurement Interval**. Otherwise "Failed!" is printed.

CLAUSE 7 – TRANSACTION AND SYSTEM PROPERTIES (ACID)

7.1 ACID Properties

- 7.1.1 The **ACID** (Atomicity, Consistency, Isolation, and Durability) properties of transaction processing systems must be supported by the **System Under Test** during the running of this benchmark.
- 7.1.2 It is the intent of this section to define the **ACID** properties informally and to specify a series of tests that must be performed to demonstrate that these properties are met.
- 7.1.3 No finite series of tests can prove that the **ACID** properties are fully supported. Passing the specified tests is a necessary, but not sufficient, condition of meeting the **ACID** requirements. However, for fairness of reporting, only the tests specified here are required and must appear in the **Report** for this benchmark.
- Comment:** These tests are intended to demonstrate that the **ACID** principles are supported by the **SUT** and enabled during the performance **Test Run**. They are not intended to be an exhaustive quality assurance test.
- 7.1.4 The configuration needed to insure full **ACID** properties must be enabled during the **Test Run**. This applies to both the database (including TPC-E tables and **User-Defined Objects**) and the **Database Session(s)** used to execute the **ACID** tests and the **Test Run**.
- Comment 1:** The term “configuration” includes all database properties and characteristics that can be externally defined; this includes but is not limited to configuration and initialization files, environmental settings, SQL commands and stored procedures, loadable modules and plug-ins. For example, if the **SUT** relies on **Undo/Redo Logs**, then logging must be enabled for all **Transactions**, including those that do not include rollback in the **Transaction Profile**.
- Comment 2:** When this benchmark is implemented on a distributed system, tests must be performed to verify that **Transactions** that are processed on two or more nodes satisfy the **ACID** properties.
- 7.1.5 Although the **ACID** tests do not exercise all **Transaction** types of this workload, the **ACID** properties must be satisfied for all **Transactions**.
- 7.1.6 **Test Sponsors** reporting **TPC Results** may perform **ACID** tests on any one system for which **Results** have been submitted, provided that they use the same software executables (e.g. **Operating System**, database manager, transaction programs). For example, this clause would be applicable when **Results** are **reported** for multiple systems in a product line. However, the **Durability** tests described in Clauses 7.5.7 and 7.6.3.5 must be run on all the systems that are measured. All **FDRs** must identify the systems that were used to verify **ACID** requirements and full details of the **ACID** tests conducted and results obtained.

7.2 Atomicity Requirements

7.2.1 Atomicity Property Definition

The **System Under Test** must guarantee that **Database Transactions** are atomic; the system will either perform all individual operations on the data, or will ensure that no partially completed operations leave any effects on the data.

7.2.2 Atomicity Tests

Perform a market Trade-Order **Transaction** with the *roll_it_back* flag set to 0. Verify that the appropriate rows have been inserted in the TRADE and TRADE_HISTORY tables.

Perform a market Trade-Order **Transaction** with the *roll_it_back* flag set to 1. Verify that no rows associated with the rolled back Trade-Order have been added to the TRADE and TRADE_HISTORY tables.

7.3 Consistency Requirements

7.3.1 Consistency Property Definition

Consistency is the property of the **Application** that requires any execution of a **Database Transaction** to take the database from one consistent state to another.

7.3.1.1 A TPC-E database when first populated by **EGenLoader** must meet these consistency conditions.

7.3.1.2 If data is replicated, as permitted under Clause 2.3.4, each copy must meet the consistency conditions defined in Clause 7.3.2.

7.3.2 Consistency Conditions

Three consistency conditions are defined in the following clauses. Explicit demonstration that the conditions are satisfied is required for all three conditions.

7.3.2.1 Consistency condition 1

Entries in the BROKER and TRADE tables must satisfy the relationship:

$$B_NUM_TRADES = \text{count}(*)$$

For each broker defined by:

$$(B_ID = CA_B_ID) \text{ and } (CA_ID = T_CA_ID) \text{ and } (T_ST_ID = "CMPT").$$

7.3.2.2 Consistency condition 2

Entries in the BROKER and TRADE tables must satisfy the relationship:

$$B_COMM_TOTAL = \text{sum}(T_COMM)$$

For each broker defined by:

$$(B_ID = CA_B_ID) \text{ and } (CA_ID = T_CA_ID) \text{ and } (T_ST_ID = "CMPT").$$

7.3.2.3 Consistency condition 3

Entries in the HOLDING_SUMMARY and HOLDING tables must satisfy the relationship:

$$HS_QTY = \text{sum}(H_QTY)$$

For each holding summary defined by:

$$(HS_CA_ID = H_CA_ID) \text{ and } (HS_S_SYMB = H_S_SYMB).$$

7.3.3 Consistency Tests

The three consistency conditions must be tested after initial database population and after any **Business Recovery** tests.

7.4 Isolation Requirements

7.4.1 Isolation Property Definition

7.4.1.1 Given a **Transaction** T1 and a concurrently executing **Transaction** T2, the following phenomena (P0 to P3) are defined as they occur in T1.

- **P0 ("Dirty Write")** - **Transaction** T2 modifies (or inserts) data element R. Then, before T2 performs a COMMIT, **Transaction** T1 starts and is able to modify (or delete) data element R and is subsequently able to perform a COMMIT.

Comment: T2 may execute additional database operations based on the state it left data element R in, potentially compromising the consistency of the data.

- **P1 ("Dirty Read")** - **Transaction** T2 modifies (or inserts) data element R. Then, before T2 performs a COMMIT, **Transaction** T1 starts, reads data element R and is able to obtain the state of the data element as changed by T2. Subsequently, T2 is able to perform a ROLLBACK.

Comment: T1 may execute additional database operations based on a state of data element R that has been rolled back and is considered to have never existed, potentially compromising the consistency of the data.

- **P2 ("Non-repeatable Read")** - **Transaction** T1 reads data element R. Then, before T1 performs a COMMIT, **Transaction** T2 starts, modifies (or deletes) data element R and performs a COMMIT. Subsequently, T1 repeats the read of data element R and is able to obtain the state of the data element as changed by T2.

Comment: Prior to discovering the modified (or deleted) state of data element R, T1 may have executed additional database operations based on a state of data element R that is considered to be no longer correct, potentially compromising the consistency of the data.

- **P3 ("Phantom Read")** - **Transaction** T1 reads a set of data elements that satisfy some <search condition>. Then, before T1 performs a COMMIT, **Transaction** T2 starts and inserts (or deletes) one or more data elements that satisfy the <search condition> used by T1. Subsequently, T1 repeats the initial read with the same <search condition> and is able to obtain a different set of data elements than the initial set.

Comment: Prior to discovering the larger (or smaller), set of data elements, T1 may have executed additional database operations based on a set of data elements that is considered to no longer match the <search condition>, potentially compromising the consistency of the data.

7.4.1.2 The isolation property of a **Transaction** is the level to which it is isolated from the actions of other concurrently executing **Transactions**. The table below, arranged from least (L0) to most (L3) restrictive, defines four isolation levels based on which phenomena must not occur.

		Phenomena			
		P0	P1	P2	P3
Isolation Level	L0	Must not occur	Is possible	Is possible	Is possible
	L1	Must not occur	Must not occur	Is possible	Is possible
	L2	Must not occur	Must not occur	Must not occur	Is possible
	L3	Must not occur	Must not occur	Must not occur	Must not occur

7.4.1.3 During the **Test Run**, each TPC-E **Transaction** must provide a level of isolation from **Arbitrary Transactions** that is at least as restrictive as the level defined in the table below:

TPC-E Transaction	Isolation Level
Trade-Result	L3
Market-Feed Trade-Order Trade-Update	L2
Broker-Volume Customer-Position Data-Maintenance Market-Watch Security-Detail Trade-Lookup Trade-Status	L1

- 7.4.1.4 During the **Test Run** the SUT must allow concurrent execution of **Arbitrary Transactions**.
- 7.4.1.5 During the **Test Run**, the data read by each TPC-E **Transaction** must be no older than the most recently **Committed** data at the time the **Transaction** started.
- 7.4.1.6 Systems that implement **Transaction** isolation using a locking and/or versioning scheme must demonstrate compliance with the isolation requirements by executing the tests described in Clause 7.4.2.
- 7.4.1.7 Systems that implement **Transaction** isolation using techniques other than a locking and/or versioning scheme may require different techniques to demonstrate compliance with the isolation requirements. It is the responsibility of the **Test Sponsor**, in collaboration with the **Auditor**, to define those techniques, to implement them, to execute them as a demonstration of compliance with the isolation requirements and to provide sufficient details in the **FDR** to support the assertion that the isolation requirements were met.

7.4.2 Isolation Tests

The following isolation tests are designed to verify that the configuration and implementation of the **System Under Test** provides the **Transactions** with the required isolation levels defined in Clause 7.4.1.3.

7.4.2.1 P3 Test in Read-Write

This test demonstrates that a read-write Trade-Result **Transaction** is protected against the Phantom phenomenon P3 when executing concurrently with another read-write Trade-Result **Transaction**. The second Trade-Result **Transaction** (**Session S4** below) plays the role of an **Arbitrary Transaction** that is inserting a row into a range of the HOLDING_SUMMARY table which has been accessed by the first Trade-Result **Transaction** (**Session S3** below).

For the purpose of this test, the two Trade-Result **Transactions** must be instrumented to record *hs_qty* after returning from **Frame 1**. In addition, the Trade-Result **Transaction** executed by S3 must be able to repeat the execution of **Frame 1** and to be able to pause before starting the execution of **Frame 2**.

Using four **Sessions**, S1 to S4, the following steps are executed in order:

- From S1, select an *acct_id*. Using an ad hoc read-only transaction, find a *symbol* that does not have a corresponding row in the HOLDING_SUMMARY table for the selected *acct_id* and perform a commit.

2. From S1, request and successfully complete a Trade-Order for the *acct_id* and *symbol* selected in step 1. Record the *trade_id* assigned to this new trade.
3. From S2, request and successfully complete another Trade-Order for the *acct_id* and *symbol* used in step 2. Record the *trade_id* assigned to this new trade.
4. From S3, request a Trade-Result for the *trade_id* from step 2. Pause between **Frame 1** and **Frame 2**. Record *hs_qty* and verify that it is set to zero.
5. From S4, request a Trade-Result for the *trade_id* from step 3. Verify that it completes **Frame 1** and starts execution of **Frame 2**. Record *hs_qty* and verify that it is set to zero.

Case A, if S4 stalls in **Frame 2**, then rolls back, while S3 completes:

- 6A. From S3, repeat the execution of **Frame 1** and pause again between **Frame 1** and **Frame 2**. Record *hs_qty* and verify that it is set to zero.
- 7A. Resume execution of S3 at **Frame 2**. Verify the successful completion of the remaining **Frames**.
- 8A. Verify that S4 rolled back.

Case B, if S4 completes (perhaps after stall) and S3 rolls back:

- 6B. Verify that S4 completes the execution of **Frame 2** and of the remaining **Frames**.
- 7B. Verify that S3 rolled back.

Case C, if S4 stalls in **Frame 1** (Invalid):

- 6C. If this case occurs, the test is invalid. To properly test protection against phantom reads, **Session S4** must get to the point in Trade-Result **Frame 2** where a row is inserted into HOLDING_SUMMARY. The Trade-Result **Transaction** used for S4 may need to be modified to prevent it from blocking in **Frame 1**. For example, it may be executed at the lower isolation level of an **Arbitrary Transaction**.

Comment 1: This P3 test is successful if either Case A or B is followed. It fails if Case C occurs. Other valid possibilities may exist (e.g., both S3 and S4 could fail), but if both S3 and S4 record *hs_qty* = 0 from execution of **Frame 1**, then at most one of these **Sessions** may complete normally and commit the **Transaction**. The intent of this test is to demonstrate that in all circumstances when S3 repeats the read on the HOLDING_SUMMARY table after S4 has inserted (or attempted to insert) a new row for the selected *acct_id* and *symbol*, there is still no qualifying row found by S3.

Comment 2: This isolation test creates one or more new holdings. Subsequently executing the P2 Test in Read-Write (see Clause 7.4.2.2) for the same selected *acct_id* and *symbol* can result in closing the positions created during the execution of this test.

7.4.2.2 P2 Test in Read-Write

This test demonstrates that a read-write Trade-Result **Transaction** is protected against the Non-repeatable Read phenomenon P2 when executing concurrently with another read-write Trade-Result **Transaction**. The second Trade-Result **Transaction** (**Session S4** below) plays the role of an **Arbitrary Transaction** that is updating a row in the HOLDING_SUMMARY table which has been read by the first Trade-Result **Transaction** (**Session S3** below).

For the purpose of this test, the two Trade-Result **Transactions** must be instrumented to record *hs_qty* after returning from **Frame 1**. In addition, the Trade-Result **Transaction** executed by S3 must be able to repeat the execution of **Frame 1** and to be able to pause before starting the execution of **Frame 2**.

Using four **Sessions**, S1 to S4, the following steps are executed in order:

1. From S1, select an *acct_id*. Using an ad hoc read-only transaction, find a *symbol* that has a corresponding row in the HOLDING_SUMMARY table for the selected *acct_id*, record the HS_QTY for that holding and perform a commit.

2. From S1, request and successfully complete a Trade-Order for the *acct_id* and *symbol* selected in step 1. Record the *trade_id* assigned to this new trade.
3. From S2, request and successfully complete another Trade-Order for the *acct_id* and *symbol* used in step 2. Record the *trade_id* assigned to this new trade.
4. From S3, request a Trade-Result for the *trade_id* from step 2 and pause between **Frame 1** and **Frame 2**. Record *hs_qty* and verify that it is equal to HS_QTY from step 1.
5. From S4, request a Trade-Result for the *trade_id* from step 3. Verify that it completes **Frame 1** and starts execution of **Frame 2**. Record *hs_qty* and verify that it is equal to HS_QTY from step 1.

Case A, if S4 stalls in **Frame 2**, then rolls back, while S3 completes:

6A. From S3, repeat the execution of **Frame 1** and pause again between **Frame 1** and **Frame 2**. Record *hs_qty* and verify that it is equal to HS_QTY from step 1.

7A. Resume execution of S3 by invoking **Frame 2**. Verify the successful completion of the remaining **Frames**.

8A. Verify that S4 rolled back.

Case B, if S4 completes (perhaps after stall) and S3 rolls back:

6B. Verify that S4 completes the execution of **Frame 2** and the remaining **Frames**.

7B. Verify that S3 rolled back.

Case C, if S4 stalls in **Frame 1** (Invalid):

6C. If this case occurs, the test is invalid. To properly test protection against the Non-repeatable Read phenomenon P2, **Session S4** must get to the point in Trade-Result **Frame 2** where a row is updated in HOLDING_SUMMARY. The Trade-Result **Transaction** used for S4 may need to be modified to prevent it blocking in **Frame 1**. For example, it may be executed at the lower isolation level of an **Arbitrary Transaction**.

Comment: This test is successful if either Case A or B is followed. It fails if Case C occurs. Other valid possibilities may exist (e.g., both S3 and S4 could fail), but if both S3 and S4 record the same *hs_qty* value from execution of **Frame 1**, then at most one of these **Sessions** may complete normally and commit the **Transaction**. The intent of this test is to demonstrate that in all circumstances when S3 repeats the read on the HOLDING_SUMMARY table for the selected *acct_id* and *symbol*, the row found and value is the same as in Step 1.

7.4.2.3 P1 Test in Read-Write

This test demonstrates that a read-write Trade-Result **Transaction** is protected against the dirty-read phenomenon P1 when executing concurrently with another read-write Trade-Result **Transaction**. For the purpose of this test the Trade-Result **Transaction** must be instrumented to record *se_amount* after returning from **Frame 5** and to be able to pause in **Frame 6** just prior to committing.

Using three **Sessions**, S1 to S3, the following steps are executed in order:

1. From S1, request a Customer-Position for a selected *cust_id*, complete the **Transaction** and record the set of resulting *acct_id[]* and *cash_ball[]*.
2. From S1, request and successfully complete a Trade-Order from an *acct_id* selected from the set recorded in step 1, for a given *symbol* and with a *type_is_margin* set to 0. Record the *trade_id* assigned to this new trade.
3. From S1, request and successfully complete another Trade-Order for the same *acct_id* but a different *symbol* than that used in step 2, and with a *type_is_margin* set to 0. Record the *trade_id* assigned to this new trade.
4. From S2, request a Trade-Result for the *trade_id* from step 2. Before invoking **Frame 6**, record *se_amount*, then invoke **Frame 6** and pause before committing.

5. From S3, request a Trade-Result for the *trade_id* from step 3. The **Transaction** may pause or fail or be temporarily blocked from fully executing. If it reaches the start of **Frame 6**, record *se_amount*, then invoke **Frame 6**. If it reaches the end of **Frame 6**, pause before committing.
6. From S2, proceed with committing and successfully completing the **Transaction**. Record the resulting *acct_bal*.
7. From S3, depending on how the **Transaction** behaved at the end of step 5:
 - If it reached the pause in **Frame 6**, allow it to proceed and verify that it **Committed** and completed successfully.
 - If it was blocked before the end of **Frame 5**, verify that it was released, completed **Frame 5**, recorded *se_amount*, executed **Frame 6**, **Committed** and completed successfully.
 - If it failed and was forced to rollback, repeat the Trade-Result request with the same *trade_id* input parameter. Verify that the Trade-Result executes in full, records *se_amount* at the start of **Frame 6**, commits at the end of **Frame 6** and completes successfully.
8. From S3, record the resulting *acct_bal* and verify that it is equal to *cash_bal[]* from step 1 (for the *acct_id* chosen in step 2) plus the sum of the *se_amount* outputs for the two Trade-Results.

7.4.2.4 P1 Test in Read-Only

This test demonstrates that the read-only Customer-Position **Transaction** is protected against the dirty-read phenomenon P1 when executing concurrently with the read-write Trade-Result **Transaction**. For the purpose of this test the Trade-Result **Transaction** must be instrumented to be able to pause in **Frame 6** just prior to committing.

Using four **Sessions**, S1 to S4, the following steps are executed in order:

1. From S1, request a Customer-Position for a selected *cust_id*, complete the **Transaction** and record the set of resulting *acct_id[]* and *cash_bal[]*.
2. From S1, request and successfully complete a Trade-Order where the associated *acct_id* input matches one of the *acct_id[]* recorded in step 1 and *type_is_margin* is 0. Record the *trade_id* assigned to this new trade.
3. From S2, request a Trade-Result for the *trade_id* from step 2 and then pause in **Frame 6** before committing.
4. From S3, request a Customer-Position for the *cust_id* selected in step 1. The **Transaction** may complete or fail or be temporarily blocked from fully executing.
5. From S2, proceed with committing and successfully completing the Trade-Result **Transaction**. Record the resulting *acct_bal*.
6. From S3, depending on how the Customer-Position **Transaction** behaved at the end of step 4:
 - If it completed, record the set of resulting *acct_id[]* and *cash_bal[]* and verify that the *cash_bal* for the *acct_id* used in step 2 is unchanged from step 1.
 - If it was blocked, verify that it has now completed, record the set of resulting *acct_id[]* and *cash_bal[]* and verify that the *cash_bal* for the *acct_id* used in step 2 matches the *acct_bal* from step 5.
 - If it failed, proceed to the next step.
7. From S4, request a Customer-Position for the *cust_id* selected in step 1, complete the **Transaction**, record the set of resulting *acct_id[]* and *cash_bal[]* and verify that the *cash_bal* for the *acct_id* used in step 2 has changed from step 1 and reflects the amount of the trade completed in step 5 (by matching *acct_bal* from step 5).

7.5 Durability Requirements

No system provides complete data protection under all possible types and/or combinations of failures. However, data protection against any Single Point of Failure is commonly expected. Therefore, the intent of this clause is to ensure that the **SUT** has no unrecoverable **Single Points of Failure**. The required data protection is satisfied by the **SUT** persisting certain data across certain types of failures.

This clause provides details on:

- Which data must persist
- Which types of failures must be protected against
- Which steps to follow for the testing/demonstration
- Which results must be disclosed

Comment: The limited nature of the tests described in this clause must not be interpreted to allow other unrecoverable Single Points of Failure.

7.5.1 Definition of Commit

The concept of “commit” has to do with delineating the successful completion of an atomic unit of work. The following definition will be leveraged to focus the scope of which data must be persisted by the **SUT**.

Commit: a control operation that:

- Is initiated by a unit of work (a **Transaction**)
- Is implemented by the **DBMS**
- Signifies that the unit of work has completed successfully and all tentatively modified data are to persist (until modified by some other operation or unit of work)

Upon successful completion of this control operation both the **Transaction** and the data are said to be **Committed**.

7.5.2 Definition of Vulnerable Storage Component

The **SUT** is composed of many different individual components; each of which represents a **Single Point of Failure**. However, the individual failure of many of these components (e.g. the monitor on a client machine) would not compromise the **SUT**’s ability to persist the necessary data. The following definition will be leveraged to focus the scope of which storage components within the **SUT** represent potential vulnerabilities.

Vulnerable Storage Component – any Field Replaceable Unit (FRU) within the **SUT** that:

- Has volatile storage (i.e. is not **Durable Media**)
- Participates in implementing the **Commit** control operation

Example: Assume an implementation like the one in Clause 4.3.1:

- The database server CPU registers and cache, database server main memory and database I/O controllers with caches (all found in **Tier B**) are considered to participate in implementing **Commit** operations
- The client front end CPU registers and caches, main memory and I/O controllers with caches are not considered to participate in implementing **Commit** operations.

7.5.3 Definition of Single Point(s) of Failure

This clause lists various types of failures that can occur within the **SUT**. This list will be leveraged to focus the scope of failures the **SUT** must protect against.

Any single item covered here is defined to be a **Single Point of Failure**; when two or more items are being discussed, the term **Single Points of Failure** is used.

7.5.3.1 **Loss of Processing**

This failure covers an instantaneous interruption in processing **Commit** control operations (e.g. system crash / system hang) that requires a system reboot to recover. This implies an immediate abnormal system shutdown that requires loading a fresh copy of the **Operating System** from the boot device. It does not necessarily imply loss of volatile memory. A sample mechanism to survive this type of failure is an **Undo/Redo Log**.

7.5.3.2 **Loss of Vulnerable Storage Component**

The failure of a **Vulnerable Storage Component** means that the data it contained is lost. The failure may be caused by a loss of power to the **Vulnerable Storage Component** or because of a failure internal to the **Vulnerable Storage Component** that renders the whole **Vulnerable Storage Component** inoperable.

7.5.3.3 **Loss of All External Power to the SUT**

This failure covers the loss of all external power to the **SUT** for an indefinite period of time. This must include at least all portions of the **SUT** that contain **Vulnerable Storage Component** and/or process **Commit** control operations.

7.5.4 **Definition of Durable / Durability**

The **SUT** must provide **Durability** as defined in this clause.

Durable / Durability: In general, state that persists across failures is said to be **Durable** and an implementation that ensures state persists across failures is said to provide **Durability**. In the context of the benchmark, **Durability** is more tightly defined as the **SUT**'s ability to ensure all **Committed** data persist across any **Single Point of Failure**.

7.5.5 **Durability Testing Rules and Guidelines**

The intent of this clause is to cover specific rules and special-case guidelines.

7.5.5.1 **Durability Throughput Requirements**

All **Durability** tests must meet the following requirements:

- Be performed with the same number of **Configured Customers** and **Driver** load used for the **Measurement Interval**.
- Be in **Steady State**.
- Satisfy the **Response Time** constraints in Clause 6.5.1.2.
- Satisfy the **Transaction Mix** requirements listed in Clause 6.3.1.
- Be at or above 95% of the **Reported Throughput** with no errors.
- Match all **Driver** and **SUT** configuration settings used during the **Measurement Interval**.

7.5.5.2 **Instantaneous Failures**

Single Points of Failure must be induced instantaneously without any foreknowledge given to the **SUT**.

7.5.5.3 Simulated Failures

A **Single Point of Failure** may be simulated if the effects on the SUT are identical to those of the actual occurrence of the **Single Point of Failure**.

7.5.5.4 Combined Failures

A single test may be used to evaluate Durability across multiple **Single Points of Failure** if the integrity of the evaluation is not compromised when compared to evaluating each **Single Point of Failure** with a separate test.

Example: Assume a **Test Sponsor** would like to combine two **Single Points of Failure** in a single test. The test is started and ramps up to a state that satisfies the **Durability Throughput Requirements**. The **Test Sponsor** now induces the first **Single Point of Failure**.

- If after inducing the first **Single Point of Failure** the SUT continues to operate at a level that satisfies the **Durability Throughput Requirements** the **Test Sponsor** may go ahead and induce the second **Single Point of Failure** since the integrity of the evaluation of the second **Single Point of Failure** has not been compromised.
- However, if inducing the first **Single Point of Failure** causes the SUT's performance to decline such that the **Durability Throughput Requirements** are no longer met, inducing the second **Single Point of Failure** would no longer be a compliant demonstration. The integrity of the evaluation of the second **Single Point of Failure** has been compromised since the **SUT** is no longer operating at a level that satisfies the **Durability Throughput Requirements**.
- Lastly, assume inducing the first **Single Point of Failure** causes the SUT's performance to decline such that the **Durability Throughput Requirements** are no longer met. Since the **SUT** is allowed to continue running and is able to regain a level of performance that satisfies the **Durability Throughput Requirements**. At this point, the **Test Sponsor** may go ahead and induce a second **Single Point of Failure** since the integrity of the evaluation of the second **Single Point of Failure** has not been compromised.

Comment: This example focused on Durability Throughput Requirements when evaluating whether combining multiple **Single Points of Failure** into a single test was compliant. There may be other criteria that must be considered when evaluating if a particular combination of **Single Points of Failure** into a single test is compliant.

7.5.5.5 Multiple Identical Single Points of Failure

If the SUT contains multiple identical **Single Points of Failure** as defined in Clause 7.5.3 that perform identical benchmark functions, successful demonstration of **Durability** for one instance is sufficient; there is no requirement to repeat the demonstration for all the other instances unless directed to do so by the **Auditor**.

This exemption from testing multiple identical instances does not apply when demonstrating Durability for Clause 7.5.3.3.

Example - Loss of Processing: In configurations where more than one instance of an **Operating System** performs an identical benchmark function, **Durability** for the failure in Clause 7.5.3.1 must be completed on at least one such instance.

Example - Loss of Vulnerable Storage Component: Assume an implementation that contains 4 disk controllers, each with write-back caching enabled, configured into 2 mirrored pairs. Further assume that each pair of controllers is configured with the same number and types of drives.

- If the drives for each controller pair are configured identically with respect to their contents (i.e. same mixture and proportion of database tables) then these 2 controller pairs are identical **Single Points of Failure**. As such, demonstrating **Durability** across one pair (by failing one of the controllers in the pair) is sufficient; there is no need to demonstrate **Durability** across the second pair as well.
- If however, one pair of controllers had disks configured with database tables and the other controller pair had disks configured with database logs, then **Durability** must be demonstrated across each pair since they are performing different benchmark functions and therefore are not identical **Single Point of Failure**.

Example - Loss of All External Power to the SUT: Assume a database cluster with multiple identical nodes where each node contains **Vulnerable Storage Components**. Performing a power failure test for just one node is not sufficient because the exemption from testing multiple identical instances does not apply when demonstrating **Durability** for Clause 7.5.3.3.

7.5.5.6 Multi-OS Interconnects as a Single Point of Failure

If multiple instances of an **Operating System** manage data that is maintained as a single image for the benchmark applications and those instances are connected via a physical medium other than an integrated bus (e.g. bus extender cable, high speed LAN, or other connection methods between the multiple instances of the **Operating System** that could be vulnerable to a loss from physical disruption), the instantaneous interruption of this communication is included as an item that must be tested in conjunction with Clause 7.5.3.1. Interruption of one instance of redundant connections is required.

Comment: It is not the intention of this clause to require interruption of communication to disk towers or a disk subsystem where redundancy exists.

7.5.5.7 Simultaneity of External Power Loss Across Multiple Components

When demonstrating **Durability** for the loss of all external power to the **SUT** (per Clause 7.5.3.3), all portions of the **SUT** that are required to be included must lose power simultaneously. For ease of benchmarking, up to three seconds is allowed between the time power is lost to the first component and the time power is lost to the last component.

7.5.5.8 UPSs – Protecting Against Loss of All External Power

UPSs may be included in the **Priced Configuration** as a means of protecting the **SUT** from the loss of all external power (per Clause 7.5.3.3). The general idea is along the lines of the following:

- The power grid supplying the data center goes offline thus causing a loss of external power to the **SUT**. The UPSs provide power to the **SUT** seamlessly.
- Without operator intervention:
 - The **SUT** detects the loss of power.
 - The **SUT** initiates an orderly process for handling the situation (e.g. a controlled system shutdown).
 - Any/all relevant data that are not on **Durable Media** are transferred to **Durable Media**.
 - The orderly handling process completes successfully.

The expectation is that the **SUT** is now protected for the indefinite time period required by Clause 7.5.3.3. The risk of UPSs and/or batteries running out of power is no longer a concern because all relevant data are on **Durable Media**.

In general, simply pricing the UPSs is sufficient; there is no requirement to demonstrate the above scenario unless directed to do so by an **Auditor**.

7.5.5.9 UPSs – Sizing of Priced UPSs

The priced UPSs must be sized to provide power for at least 30 minutes of uninterrupted operations. The 30-minute power consumption of the protected portion of the **SUT** must be either:

- Measured during a **Test Run** or
- A calculation of the 30-minute power requirements (in watts) for the protected portion of the **SUT** multiplied by 1.4.

7.5.5.10 UPSs – Representing Single Points of Failure

When pricing UPSs as protection against Clause 7.5.3.3, each UPS is defined to be a new **Single Point of Failure**. As such, the **SUT** must provide **Durability** across the independent failure of each UPS.

7.5.6 Definition of Recovery Terms

7.5.6.1 Database Recovery

Database Recovery: the process of recovering the database from a **Single Point of Failure** system failure.

7.5.6.2 Database Recovery – Start Time

The start of **Database Recovery** is the time at which database files are first accessed by a process that has knowledge of the contents of the files and has the intent to recover the database or issue **Transactions** against the database.

Comment: Access to files by **Operating System** processes that check for integrity of file systems or volumes to repair damaged data structures does not constitute the start of **Database Recovery**.

7.5.6.3 Database Recovery – End Time

The end of **Database Recovery** is the time at which database files have been recovered.

Comment: The database will usually report this time in its log files.

7.5.6.4 Database Recovery Time

Database Recovery Time: the duration from the start of **Database Recovery** to the point when database files complete recovery.

7.5.6.5 Application Recovery

Application Recovery: the process of recovering the business application after a **Single Point of Failure** and reaching a point where the business meets certain operational criteria.

7.5.6.6 Application Recovery – Start Time

The start of **Application Recovery** is the time when the first **Transaction** is submitted after the start of **Database Recovery**.

7.5.6.7 Application Recovery – End Time

The end of **Application Recovery** is the first time, T, after the start of **Application Recovery** at which the following conditions are met:

- The one-minute average tpsE (i.e. average tpsE over the interval from T to T + 1 minute) is greater than or equal to 95% of **Reported Throughput**
- The 20-minute average tpsE (i.e. average tpsE over the interval from T to T + 20 minutes) is greater than or equal to 95% of **Reported Throughput**.

Comment: When considering the 20-minute interval, the average tpsE for the first minute must be at or above 95% of **Reported Throughput** (as required by the first bullet above). However, some number of the subsequent 19 one-minute average tpsE values may drop below 95% of **Reported Throughput**. This is acceptable as long as the overall 20-minute average tpsE is not less than 95% of **Reported Throughput** (as required by the second bullet above).

7.5.6.8 Application Recovery Time

Application Recovery Time: The elapsed time between the start of **Application Recovery** and the end of **Application Recovery** (see Clause 7.5.6.5).

7.5.6.9 Business Recovery

Business Recovery: the process of recovering from a **Single Point of Failure** and reaching a point where the business meets certain operational criteria.

7.5.6.10 Business Recovery Time

Business Recovery Time: the elapsed period of time between start of **Business Recovery** and end of **Business Recovery** (see Clause 7.5.6.9).

Comment: **Single Points of Failure** can be very disruptive to business processing, therefore it is imperative for businesses to recover from these failures as quickly as possible. There are many database configuration parameters and practices that directly affect the performance of the **DBMS** and its recovery time from a **Single Point of Failure**. However, while it is recognized that boot times for systems vary greatly, boot parameters have little to no affect on the performance of the **DBMS**. For this reason, server boot times are not included as part of the **Business Recovery Time**.

7.5.7 Durability Test Procedure for Single Points of Failures

1. Determine the current number of completed trades in the database by running:
select count() as count1 from SETTLEMENT.*
 2. Start **Test Run 1** by submitting **Transactions** and ramp up to the **Durability Throughput Requirements** (as defined in Clause 7.5.5.1) and satisfy those requirements for at least 20 minutes.
 3. Induce one or more of the **Single Points of Failure** failures, from Clause 7.5.3.
 4. If appropriate for the test configuration, stop submitting **Transactions**.
 5. If necessary, restart the **SUT** (may necessitate a full reboot).
 6. Note the time when **Database Recovery** starts (see Clause 7.5.6.2), either automatically or manually by an operator.
 7. When **Database Recovery** ends, note the time. This may occur during the following steps (see Clause 7.5.6.3).
 8. Start **Test Run 2** or continue **Test Run 1** submitting **Transactions** and note this time as the start of **Application Recovery** (see Clause 0). Ramp up to 95% of **Reported Throughput**.
- Comment:** If there is a time gap between the end of **Database Recovery** and the start of **Application Recovery** and if **Drivers** and **Transactions** need to be started again (not just continued), then the **Trade-Cleanup Transaction** may be executed during this time gap.
9. Note the end of **Application Recovery** as defined in Clause 7.5.6.7.
 10. Terminate the **Driver** gracefully.

11. Verify that no errors were reported by the **Driver** during steps 7 through 10. The intent is to ensure that an end-user would not see any adverse effects (aside from availability of the application and potentially reduced performance) due to the **SUT** failure and subsequent **Business Recovery**.
 12. Retrieve the new number of completed trades in the database by running:

```
select count(*) as count2 from SETTLEMENT
```
 13. Compare the number of completed Trade-Result **Transactions** on the **Driver** to (count2 - count1). Verify that (count2 - count1) is greater or equal to the aggregate number of successful Trade-Result **Transaction** records in the **Driver** log file for the runs performed in step 2 and step 8. If there is an inequality, the **SETTLEMENT** table must contain additional records and the difference must be less than or equal to the maximum number of **Transactions** which can be simultaneously in-flight from the **Driver** to the **SUT**. This number is specific to the implementation of the **Driver** and configuration settings at the time of the crash.
- Comment:** This difference must be due only to **Transactions** which were **Committed** on the **System Under Test**, but for which the output data was not returned to the **Driver** before the failure.
14. Verify consistency conditions as specified in Clause 7.3.3.
 15. Calculate **Business Recovery Time** as the sum of **Application Recovery Time** and **Database Recovery Time**, if those times do not overlap. If **Application Recovery** begins before **Database Recovery** is complete, **Business Recovery Time** is the time elapsed between the beginning of **Database Recovery** and the end of **Application Recovery**.

7.5.8 Required Reporting for Durability

7.5.8.1 Reported Metrics

The **Business Recovery Time** must be **reported** on the **Executive Summary Statement** and in the **Report**. If the failures described in Clauses 7.5.3.1, 7.5.3.2 and 7.5.3.3 were not combined into one **Durability** test (usually powering off the **Database Server** during the run), then the **Business Recovery Time** for the failure described for instantaneous interruption is the **Business Recovery Time** that must be **reported** in the **Executive Summary Statement**. All the **Business Recovery Times** for each test requiring **Business Recovery** must be **reported** in the **Report**.

7.5.8.2 The Test Sponsor must report the Redundancy Level and describe the test(s) used to demonstrate compliance in the **Report**.

7.5.8.3 Business Recovery Time Graph

A graph of the one-minute average tpsE versus elapsed time must be **reported** in the **Report** for the run portions of the **Business Recovery** tests, prepared in accordance with the following conventions:

- The x-axis represents the maximum of the elapsed times for the two runs described in Clause 7.5.7 steps 2 and 8
- The y-axis represents the throughput in tpsE (computed as the total number of Trade-Result **Transactions** that complete within each one-minute interval divided by 60)
- A plot interval size of 1 minute must be used
- The y-axis data for both runs is to be overlaid on a single graph, with the end times of each run clearly marked
- For graphing purposes, time 0 is defined as follows:
- For the run outlined in 7.5.7 step 2, time 0 is defined as the point in time where the first **Transaction** is issued to the database

- For the run outlined in 7.5.7 step 8, time 0 is defined as the point in time where **Database Recovery** begins
- For graphing purposes, the end of the run is defined as follows:
- For the run outlined in 7.5.7 step 2, the end of the run is the time at which the failure is induced (see 7.5.7 step 3)
- For the run outlined in 7.5.7 step 8, the end of the run is the time at which the **Application Recovery** has ended successfully (see 7.5.7 step 8)
- For the run outlined in 7.5.7 step 8, if any time elapses between the end of **Database Recovery** and the start of **Application Recovery**, this time should be ignored and the two periods should be presented adjacent on the graph.
- A horizontal line at 95% of the **Reported Throughput** must also be plotted across the graph

7.6 Data Accessibility Requirements

The **System Under Test** must be configured to satisfy the requirements for **Data Accessibility** detailed in this clause. **Data Accessibility** is demonstrated by the **SUT** being able to maintain database operations with full data access after the permanent irrecoverable failures of any single **Durable Medium** containing database tables, recovery log data, or **Database Metadata**. **Data Accessibility** tests are conducted by inducing failures of **Durable Media** within the **SUT**. The failures of Clause 7.6.3 test the ability of the **SUT** to maintain access to the data. The specific failures addressed in Clause 7.6.3 are defined sufficiently significant to justify demonstration of **Data Accessibility** across such failures. However, the limited nature of the tests listed must not be interpreted to allow other unrecoverable single points of failure.

7.6.1 Definition of Terms

7.6.1.1 **Data Accessibility**: The ability to maintain database operations with full data access after the permanent irrecoverable failure of any single **Durable Medium** containing database tables, recovery log data, or **Database Metadata**.

7.6.1.2 **Durable Medium**: a data storage medium that is inherently non-volatile such as a magnetic disk or tape. **Durable Media** is the plural of **Durable Medium**.

7.6.2 Data Accessibility Throughput Requirements

All **Data Accessibility** tests must meet the following requirements:

- Be performed with the same number of Configured Customers and Driver load used for the Measurement Interval
- Be in Steady State
- Satisfy the Response Time constraints in Clause 6.5.1.2.
- Satisfy the Transaction Mix requirements listed in Clause 6.3.1.
- Be at or above 95% of the Reported Throughput with no errors
- Match all Driver and SUT configuration settings used during the Measurement Interval

7.6.3 Failure of Durable Media

The failures detailed in this clause affect the access of data from **Durable Media**. The following requirements are also known as the **Data Accessibility** requirements.

7.6.3.1 The **SUT** must maintain database access to data on **Durable Media** during and after a permanent and irrecoverable failure of a single **Durable Medium** containing database tables, recovery log data, or **Database Metadata**. The **Test Sponsor** must also restore the **Durable Medium** environment to its pre-failure condition, while maintaining database access to the data on **Durable Media**.

7.6.3.2 **Durable Media** are inherently non-volatile and are typically magnetic disks using replication (RAID-1 mirroring) or other form of protection (RAID-5, et.al.) to guarantee access to the data during a **Durable Medium** failure. Volatile media such as memory can also be used if the volatile media can ensure the transfer of data automatically, before any data is lost, to an inherently non-volatile medium after the failure of external power independently of reapplication of external power.

Comment 1: A configured and priced Uninterruptible Power Supply (UPS) is not considered external power.

Comment 2: Memory can be considered a **Durable Medium** if it can preserve data long enough to satisfy the requirements stated above, for example, if it is accompanied by an Uninterruptible Power Supply, and the contents of memory can be transferred to an inherently non-volatile medium during the failure. Note that no distinction is made between main memory and memory performing similar permanent or temporary data storage in other parts of the system (e.g., disk controller caches). If main memory is used as a **Durable Medium**, then it must be considered as a potential single point of failure. A sample mechanism to survive single **Durable Medium** failure is mirrored **Durable Media**. If memory is the **Durable Medium** and mirroring is the mechanism used to ensure **Durability**, then the mirrored memories must be independently powered.

7.6.3.3 The Data **Accessibility** tests (aka. **Non-catastrophic** failures) must meet the **Durability Throughput Requirements** of Clause 7.6.2.

7.6.3.4 Redundancy Levels

The redundancy levels refer to the level of guarantee for data access given a single failure among the data storage components. The **SUT** must implement one of the following Redundancy Levels:

- **Redundancy Level One (Durable Media Redundancy):** Guarantees access to the data on **Durable Media** when a single **Durable Media** failure occurs.

Comment: The intent of this redundancy level is to test the ability of the **Durable Media** environment to survive the failure of a single **Durable Medium** and continue processing requests from the **Operating System** and/or **DBMS**.

Example: The **Sponsor** has implemented RAID-1 (mirroring) on the disks within an enclosure. The **Sponsor** must maintain access to the data on the remaining disks despite the induced failure of a single disk.

- **Redundancy Level Two (Durable Media Controller Redundancy):** Includes **Redundancy Level One** and guarantees access to the data on **Durable Media** when a single failure occurs in the storage controller used to satisfy the redundancy level or in the communication media between the storage controller and the **Durable Media**.

Comment: The intent of this redundancy level is to test the ability of the implementation to survive the failure of a storage controller responsible for implementing **Redundancy Level One**.

Example: If **Redundancy Level One** is satisfied by implementing RAID-5 protection within a disk enclosure, then **Redundancy Level Two** would be tested by failing the hardware used to implement the RAID-5 protection.

If the controller implementing the RAID-5 is contained within the disk enclosure (or similar externally attached device), then the **Sponsor** must demonstrate they can still access the data stored within the enclosure.

If the controller implementing the RAID-5 is separate from the enclosure containing the disks, and the controller is not being used as a **Durable Medium** (e.g. mirrored write caches), then it is sufficient to fail the communications between the controller and the enclosure.

- **Redundancy Level Three (Full Redundancy):** Includes **Redundancy Level Two** and guarantees access to the data on **Durable Media** when a single failure occurs within the **Durable Media** system, including communications between **Tier B** and the **Durable Media** system.

Comment 1: The **Durable Media** system includes all components necessary to meet the durability requirements defined above. This does not include the **Tier B** system or the system bus, but does include the adapter on the system bus and any and all components “downstream” from the adapter.

Comment 2: The intent of this clause is to test the ability of the **Tier B** system to withstand component failures and continue processing of the **Transactions**.

Comment: The components being tested by this clause are those that are considered to be Field Replaceable Units (FRUs). It is not the intent of the clause to require **Sponsors** to test the durability of a backplane inside a **Durable Media** enclosure or similar non-replaceable components. However, testing the failover properties of storage controllers, including mirrored caches on a controller, and the corresponding software, is within the intent of this clause.

7.6.3.5 Durability Test Procedure for Data Accessibility

1. Determine the current number of completed trades in the database by running:
select count() as count1 from SETTLEMENT*
2. Start submitting **Transactions** and ramp up to the **Data Accessibility Throughput Requirements** (as defined in Clause 7.6.2) and satisfy those requirements for at least 5 minutes.
Comment: Once the **Durability Throughput Requirements** are met
 - no **Driver** configuration changes are permitted until the conclusion of step 5
 - no **SUT** configuration changes are permitted except those needed to satisfy steps 3 and 4
3. Induce the failure described for the redundancy level being demonstrated.
4. Begin the necessary recovery process.
5. Continue running the **Driver** for 20 minutes.
6. Terminate the run gracefully from the **Driver**.
7. Retrieve the new number of completed trades in the database by running:
select count() as count2 from SETTLEMENT*
8. Compare the number of executed Trade-Result **Transactions** on the **Driver** to (count2 - count1). Verify that (count2 - count1) is equal to the number of successful Trade-Result **Transaction** records in the **Driver** log file.
9. Allow recovery process to complete as needed.

7.6.4 Required Reporting for Data Accessibility

- 7.6.4.1 The **Test Sponsor** must report the Redundancy Level and describe the test(s) used to demonstrate compliance in the **Report**.

7.6.4.2 Data Accessibility Graph

A graph of the one-minute average tpsE versus elapsed time must be **reported** in the **Report** for the run portions of the Data Accessibility tests, prepared in accordance with the following conventions:

- The x-axis represents the elapsed time for the runs described in Clause 7.6.3.5, steps 2 through 6
- The y-axis represents the throughput in tpsE (**computed as the total number of Trade-Result Transactions that complete within each one-minute interval divided by 60**)
- A plot interval size of 1 minute must be used
- A horizontal line at 95% of the **Reported Throughput** must also be plotted across the graph

Comment: The intent is to show how throughput is affected during recovery.

CLAUSE 8 -- PRICING

Rules for pricing the **Priced Configuration** and associated software and maintenance are included TPC Pricing Specification, located at [www\(tpc.org](http://www(tpc.org)).

The following requirements are intended to supplement the TPC Pricing Specification:

8.1 Priced Configuration

The system to be priced is the aggregation of the **SUT** and any additional component that would be required to achieve the **reported** performance level. Calculation of the priced system consists of:

- Price of the **SUT** as tested and as defined in Clause 4.2.5.
- Price of any additional storage and associated infrastructure required by the On-Line Storage Requirement in Clause 8.2.
- Price of additional products that are required for the operation, administration or maintenance of the priced system.
- Price of additional products required for **Application** development.

Comment: Any component, for example a Network Interface Card (NIC), must be included in the price of the **SUT** if it draws resources for its own operation from the **SUT**. This includes, but is not limited to, power and cooling resources. In addition, if the component performs any function defined in the TPC-E specification it must be priced regardless of where it draws its resources.

8.2 On-line Storage Requirement

8.2.1 A storage device is considered **On-Line** if it is capable of providing an access time to data, for random read or update, of one second or less by the **Operating System**.

Comment: Examples of **On-Line** storage may include magnetic disks, optical disks, solid-state storage, or any combination of these, provided that the above mentioned access criteria is met.

8.2.2 **On-Line** storage must be priced for sufficient space to store and maintain the data and **User-Defined Objects** generated during a period of 60 **Business Days** at the **Reported Throughput** called the **60-Day Period**. The calculation of **60-Day Space** is described in Clause 6.6.6.6.

8.2.3 The first **Business Day** of storage must satisfy the requirements of the Clause 6.6.7 Continuous Operations Requirement.

8.2.4 The device(s) for the remaining 59 **Business Days** of storage must be capable of being **On-Line** and capable of meeting the Data Accessibility requirements (see Clause 7.6). All, some or none of the 59 **Business Days** of storage may be present in the **Measured Configuration**.

- If the **Measured Configuration** contains more data storage than the **60-Day Space** requires, all of the configured data storage must be priced. The amount of storage priced cannot be less than what was configured in the **Measured Configuration**.
- If the **Measured Configuration** contains one or more devices identified by the **Test Sponsor** as satisfying the 59 **Business Days** of storage, these devices must be **On-Line**. Any additional storage device(s) priced must be of the same type(s).

- If the **Measured Configuration** does not contain any devices that are identified by the **Test Sponsor** as satisfying the 59 **Business Days** of storage, the storage device(s) priced must be of the same type(s) used to satisfy the requirements of the Clause 6.6.7 Continuous Operations Requirement.

Comment: Storage devices are considered to be of the same type if they are identical in all aspects of their product description and technical specifications.

8.2.5 **Archive Operation Requirement**

TPC-E has no requirements for pricing additional archive storage.

8.2.6 **Back-up Storage Requirements**

TPC-E has no requirements for on-line back-up data capabilities in the **Priced Configuration**.

8.3 **TPC-E Specific Pricing Requirements**

8.3.1 **Additional Operational Components**

- 8.3.1.1 Additional products that might be included on a customer installed configuration, such as operator consoles and magnetic tape drives, are also to be included in the priced system if explicitly required for the operation, administration, or maintenance, of the priced system.
- 8.3.1.2 Copies of the software, on appropriate media, and a software load device, if required for initial load or maintenance updates, must be included.
- 8.3.1.3 The price of an Uninterruptible Power Supply, specifically contributing to a **Durability** solution, must be included (see Clause 7.6.3.2).
- 8.3.1.4 The price of all components, including cables, used to interconnect components of the **SUT** must be included.

8.3.2 **Additional Software**

- 8.3.2.1 All software licenses must be priced for a number of users at least equal to one user for each tpsE of **Nominal Throughput**. Any usage pricing for this number of users must be based on the pricing policy of the company supplying the priced component.
- 8.3.2.2 The price must include the software licenses necessary to create, compile, link, and execute this benchmark **Application** as well as all run-time licenses required to execute on host system(s), client system(s) and connected workstation(s) if used.
- 8.3.2.3 In the event the **Application Program** is developed on a system other than the **SUT**, the price of that system and any compilers and other software used must also be included as part of the priced system.

8.4 **Component Substitution**

- 8.4.1 **Substitution** is defined as a deliberate act to replace components of the **Priced Configuration** by the **Test Sponsor** as a result of failing the availability requirements of the TPC Pricing Specification or when the **Part Number** for a component changes.

Comment: Corrections or "fixes" to components of the **Priced Configuration** are often required during the life of products. These changes are not considered **Substitutions** so long as the **Part Number** of the priced component does not change. Suppliers of hardware and software may update the components of the **Priced Configuration**, but these updates must not impact the **Reported Throughput**. The following are not considered **Substitutions**:

- software patches to resolve a security vulnerability
- silicon revision to correct errors
- new supplier of functionally equivalent components (i.e. memory chips, disk drives, ...)

8.4.2 Some hardware components of the **Priced Configuration** may be substituted after the **Test Sponsor** has demonstrated to the **Auditor's** satisfaction that the substituting components do not negatively impact the **Reported Throughput**. All **Substitutions** must be **reported** in the **Report** and noted in the **Auditor's Attestation Letter**. The following hardware components may be substituted:

- Durable Medium
- Durable Medium Enclosure
- Network interface card
- Router
- Bridge
- Repeater

8.4.3 **Tier A** (see Clause 4.2.3) hardware and software components may be substituted if the **Test Sponsor** can demonstrate to the **Auditor's** satisfaction the components are separate from similar components of **Tier B** (see Clause 4.2.4) and do not negatively impact the **Reported Throughput**.

Comment: The intent of this clause is to allow **Substitution** of the hardware and software components of **Tier A**, if those components are not integral or shared with **Tier B**. Some examples are:

1. **Tier A** and **Tier B** are composed of different systems and **Operating Systems**. **Tier A** is a single processor system and **Tier B** is a multi-processor system. There are no common or shared components between **Tier A** and **Tier B**. Any of the **Tier A** components may be substituted.
2. **Tier A** and **Tier B** share the same physical cabinet, backplane or bus and power supply. However, the tiers are demonstratively separated in all other aspects (processors, memory, **Operating System**, boot disk, etc.). Only the **Tier A** components that are separate may be substituted. Shared components between the tiers may not be substituted.
3. **Tier A** is running within a guest operating system on **Tier B** (either through software partitioning or a virtual environment). Only the software for **Tier A** may be substituted for. Since the primary hardware components are shared or virtualized they cannot be substituted.

The examples above are not representative of all possible combinations of the **Tier A** and **Tier B** components. They are provided to cover the broad categories of separate systems, hardware partitioning and software partitioning (virtualization).

8.5 Required Reporting

8.5.1 Two metrics will be **reported** with regard to pricing. The first is the total 3-year pricing as described in the effective version of the TPC Pricing specification. The second is the total 3-year pricing divided by the **Reported Throughput** (tpsE), as defined in Clause 6.7.1.

- 8.5.2 The 3-year pricing metric must be fully **reported** in the basic monetary unit of the local currency unit rounded up and the **Price/Performance Metric** must be **reported** to a minimum precision of three significant **Digits** rounded up. Neither metric may be interpolated or extrapolated. For example, if the total price is \$ 5,734,417.89 USD and the **Reported Throughput** is 105 tpsE, then the 3-year pricing is \$ 5,734,418 USD and the price/performance is \$ 54,700 USD per tpsE ($5,734,418 / 105$).

CLAUSE 9 – FULL DISCLOSURE REPORT

9.1 Full Disclosure Report Requirements

A **Full Disclosure Report (FDR)** is required. This section specifies the requirements for the **FDR**.

The **FDR** is a zip file of a directory structure containing the following:

- A **Report** in Adobe Acrobat PDF format,
- An **Executive Summary Statement** in Adobe Acrobat PDF format,
- An XML document ("ES.xml") with approximately the same information as in the **Executive Summary Statement**,
- The **Supporting Files** consisting of various source files, scripts, and listing files. Requirements for the **FDR** file directory structure are described below.

Comment: The purpose of the **FDR** is to document how a benchmark **Result** was implemented and executed in sufficient detail so that the **Result** can be reproduced given the appropriate hardware and software products.

9.1.1 General Items

- 9.1.1.1 The order and titles of sections in the **Report** and **Supporting Files** must correspond with the order and titles of sections from the TPC-E Standard Specification (i.e., this document). The intent is to make it as easy as possible for readers to compare and contrast material in different **Reports**.
- 9.1.1.2 The **FDR** must follow all reporting rules specified in the effective version of the TPC Pricing Specification, located at [www\(tpc.org](http://www(tpc.org)). For clarity and readability the TPC Pricing Specification requirements may be repeated in the TPC-E Specification.
- 9.1.1.3 The directory structure of the **FDR** has three folders:
- *ExecutiveSummaryStatement* - contains the **Executive Summary Statement** and ES.xml
 - *Report* - contains the **Report**,
 - *SupportingFiles* - contains the **Supporting Files**.
- 9.1.1.4 The reporting requirements of Clause 9 require descriptions, scripts and step by step GUI instructions that are necessary to reproduce the benchmark **Result**. The **Test Sponsor** can only provide descriptions, scripts and GUI instructions for the measured **SUT** as no knowledge is available at the time of publication of future changes in hardware or software. To meet the Clause 9.1 reproducibility requirement, the **Test Sponsor** must provide upon request any and all updated descriptions, scripts and step by step GUI instructions required to reproduce the benchmark **Result**.

9.2 Executive Summary Statement

The TPC **Executive Summary Statement** must be included near the beginning of the **Report**. An example of the **Executive Summary Statement** is presented in Appendix B. The latest version of the required format is available from the TPC Administrator. When the optional TPC-Energy standard is used, the additional requirements and formatting of TPC-Energy related items in the executive summary must be reported and used. In addition, the requirements of the TPC-Energy Specification, located at [www\(tpc.org](http://www(tpc.org), must be met.

9.2.1 First Page of the Executive Summary Statement

9.2.1.1 The first page of the **Executive Summary Statement** must include the following:

- **Sponsor's** name
- Measured server's name
- TPC-E Specification version number under which the benchmark is published
- TPC-Pricing Specification version number under which the benchmark is published
- Report date and/or Revision Date
- **Reported Throughput** in tpsE (see Clause 6.7.1)
- **Price/Performance Metric** (see TPC Pricing Specification)
- **Availability Date** (see TPC Pricing Specification)
- Total System Cost (see TPC Pricing Specification)
- **Database server's Operating System** name and version
- Database Manager name and version
- Number of **Database Server** Processors/Cores/Threads that were enabled for the benchmark (see TPC Policies located at www.tpc.org)
- Memory in GB configured on the **Database Server**
- A diagram (see Clause 9.3.1.2) describing the components of the **Priced Configuration** (see TPC Pricing Specification)
- **Initial Database Size** in GB
- Redundancy Level and Redundancy Level implementation details
- Priced number of **Durable Media** (disks) for the database

9.2.2 Additional Pages of Executive Summary Statement

9.2.2.1 The Price Spreadsheet must be included in the **Executive Summary Statement** as specified by the TPC Pricing Specification.

Price Spreadsheet Categories:

The major categories for division of the price spreadsheet are:

- Server Hardware
- Server Storage
- Server Software
- Client Hardware
- Client Software
- Infrastructure (networking, UPS, consoles, other components that do not fit into the above categories)

9.2.2.2 The name of the **Auditor** who certified the result must be included after the Price Spreadsheet.

9.2.2.3 The numerical quantities listed below must be included in the **Executive Summary Statement** after the Price Spreadsheet:

- **Reported Throughput** in tpsE (see Clause 6.7.1)
- **Configured Customers** (see Clause 2.6)
- **Measurement Interval** in hh:mm:ss (hours, minutes, seconds) (see Clause 6.6.1.5),
- **Ramp-up** time in hh:mm:ss (see Clause 6.6.1.2),

- **Business Recovery Time** in hh:mm:ss (see Clause 7.5.8.1),
- The number of **Transactions** in the **Transaction Mix** completed within the **Measurement Interval**, (report the total, and the number per **Transaction** type) (see Clause 6.3.1)
- The number of each **Transaction** type (including Data-Maintenance) completed within the **Measurement Interval**
- Percentage of **Transaction Mix** for each **Transaction** type completed within the **Measurement Interval** (see Clause 6.3.1).
- Ninetieth percentile, minimum, maximum and average **Response Times** must be **reported** for all **Transactions** of the **Transaction Mix** completed within the **Measurement Interval** (see Clause 6.5.1).
- Maximum, minimum and average **Response Times** must be **reported** for Data-Maintenance.

Comment: Appendix B contains an example of an **Executive Summary Statement**. The intent is for data to be conveniently and easily accessible in a familiar arrangement and style. It is not required to precisely mimic the layout shown in Appendix B.

9.2.3 ES.xml Requirements

9.2.3.1 The schema of the ES.xml document is defined by the XML schema document tpce-es.xsd (available from www.tpc.org). The ES.xml file must conform to the tpce-es.xsd (established by XML schema validation).

Comment: The **Sponsor** is responsible for verifying that the ES.xml file they provide in the **FDR** conforms to the TPC-E XML schema. A validation tool will be provided on the TPC web site to facilitate this verification.

9.2.3.2 Appendix C describes the structure of the XML schema, defines the individual attributes and elements, and explains how to use the schema.

9.3 Report Disclosure Requirements

9.3.1 Report Introduction

9.3.1.1 A statement identifying the benchmark **Sponsor(s)** and other participating companies must be **reported** in the **Report**.

9.3.1.2 Diagrams of both **Measured** and **Priced Configurations** must be **reported** in the **Report**, accompanied by a description of the differences. This includes, but is not limited to:

- Number and type of processors, number of cores and number of threads.
- Size of allocated memory, and any specific mapping/partitioning of memory unique to the test.
- Number and type of disk units (and controllers, if applicable).
- Number of channels or bus connections to disk units, including their protocol type.
- Number of LAN (e.g. Ethernet) connections, including routers, workstations, etc., that were physically used in the test or incorporated into the pricing structure.
- Type and the run-time execution location of software components (e.g. **DBMS**, client, processes, transaction monitors, software drivers, etc.).

Comment: Detailed diagrams for system configurations and architectures can widely vary, and it is impossible to provide exact guidelines suitable for all implementations. The intent here is to describe the system components and connections in sufficient detail to allow independent reconstruction of the measurement environment.

9.3.1.3 The following sample diagram illustrates a server benchmark (**Measured Configuration**) using a 32-processor server. The server uses 3 SCSI Controllers each attached to four 72GB 15Krpm drives. Gigabit Ethernet is used to link the **Driver** machine to the middle-tier machines, and the middle-tier machines to the server. Note that this diagram does not depict or imply any optimal configuration for the TPC-E benchmark measurement.

Figure 9.a - Example of Measured Benchmark Configuration

9.3.1.4 A description of the steps taken to configure all of the hardware must be **reported** in the **Report**. Any and all configuration scripts or step by step GUI instructions are **reported** in the **Supporting Files** (see Clause 9.4.1). The description, scripts and GUI instructions must be sufficient such that a reader knowledgeable of computer systems and the TPC-E specification could recreate the hardware environment. This includes, but is not limited to:

- A description of any firmware updates or patches to the hardware.
- A description of any GUI configuration used to configure the system hardware.
- A description of exactly how the hardware is combined to create the complete system. For example, if the **SUT** description lists a base chassis with 1 processor, a processor update package of 3 processors, a NIC controller and 3 disk controllers, a description of where and how the processors, NIC and disk controllers are placed within the base chassis must be **reported** in the **Report**.
- A description of how the hardware components are connected. The description can assume the reader is knowledgeable of computer systems and the TPC-E specification. For example, only a description that Controller 1 in slot A is connected to Disk Tower 5 is required. The reader is assumed to be knowledgeable enough to determine what type of cable is required based upon the component descriptions and how to plug the cable into the components.

9.3.1.5 A description of the steps taken to configure all software must be **reported** in the **Report**. Any and all configuration scripts or step by step GUI instructions are **reported** in the **Supporting Files** (see Clause 9.4.1.2). The description, scripts and GUI instructions must be sufficient such that a reader knowledgeable of computer systems and the TPC-E specification could recreate the software environment. This includes, but is not limited to:

- A description of any updates or patches to the software.
- A description of any changes to the software.
- A description of any GUI configurations used to configure the software.

9.3.2 **Clause 2 Database Design, Scaling & Population Related Items**

A description of the steps taken to create the database for the **Reported Throughput** must be **reported** in the **Report**. Any and all scripts or step by step GUI instructions are **reported** in the **Supporting Files** (see Clause 9.4.2). The description, scripts and GUI instructions must be sufficient such that a reader knowledgeable of database software environments and the TPC-E specification could recreate the database. This includes, but is not limited to the requirements specified in the following 9.3.2 clauses.

9.3.2.1 The physical organization of tables and **User-Defined Objects**, within the database, must be **reported** in the **Report**.

Comment: The concept of physical organization includes, but is not limited to: record clustering (i.e., rows from different logical tables are co-located on the same physical data page), index clustering (i.e., rows and leaf nodes of an index to these rows are co-located on the same physical data page), and partial fill-factors (i.e., physical data pages are left partially empty even though additional rows are available to fill them).

9.3.2.2 While few restrictions are placed upon horizontal or vertical partitioning of tables and rows in the TPC-E benchmark (see Clause 2.3.3), any such partitioning must be **reported** in the **Report**. Using the CUSTOMER table as an example, such partitioning could be denoted as:

C_part_1	C_ID
	C_TAX_ID
	C_ST_ID
	C_L_NAME
	C_F_NAME
	C_M_NAME
	C_GNDR
	C_TIER
	C_DOB
	C_AD_ID
----- Vertical partition -----	
C_part_2	C_CTRY_1
	C_AREA_1
	C_LOCAL_1
	C_EXT_1
	C_CTRY_2
	C_AREA_2
	C_LOCAL_2

C_EXT_2
 C_CTRY_3
 C_AREA_3
 C_LOCAL_3
 C_EXT_3
 C_EMAIL_1
 C_EMAIL_2

Once the partitioned database elements have been so identified, they can be referred to by, for example, their **T_part_N** notation when describing the physical allocation of database files (see Clause 9.3.2.6), where T indicates the table name and N indicates the partition segment number.

- 9.3.2.3 Replication of tables, if used, must be **reported** in the **Report** (see Clause 2.3.4).
- 9.3.2.4 Additional and/or duplicated columns in any table must be **reported** in the **Report** along with a statement on the impact on performance (see Clause 2.3.5).
- 9.3.2.5 The cardinality (e.g. the number of rows) of each table, as it existed after database load (see Clause 2.6), must be **reported** in the **Report**.
- 9.3.2.6 The distribution of tables, partitions and logs across all media must be explicitly depicted for the **Measured and Priced Configurations**.

Comment: The intent is to provide sufficient detail to allow independent reconstruction of the test database.

Disk #	Controller #	Slot #	Drives Enclosure model RAID level	Partition/file system	Size	Use
1	1	3	28 X36.4GB EEEENN Enclosure RAID 10	E: (RAW) F: (NTFS)	200.00GB 10.00GB	DB Log MDF File
2	2	4	14 X36.4GB EEEENN Enclosure RAID 10	C:\mp\dimension (RAW) C:\mp\market (RAW)	0.10GB 50.50GB	Dimension Market
3	2	4	14 X74.8GB EEEENN Enclosure RAID 10	C:\mp\customer (RAW) G: (NTFS)	70.00GB 10.00GB	Customer Backup 1
4	3	5	28 X74.8GB EEEENN Enclosure RAID 10	C:\mp\broker1 (RAW) H: (NTFS)	44.25GB 10.00GB	Broker Backup 2
5	4	1	28 X74.8GB EEEENN Enclosure RAID 10	C:\mp\broker2 (RAW) I: (NTFS)	44.25GB 10.00GB	Broker Backup 3

- 9.3.2.7 A statement must be provided in the **Report** that describes:
 - The **Database Interface** (e.g., embedded, call level) and access language (e.g., SQL, COBOL read/write) used to implement the TPC-E **Transactions**. If more than one interface / access language is used to implement TPC-E, each interface / access language must be described and a list of which interface / access language is used with which **Transaction** type must be **reported**.
 - The data model implemented by the **DBMS** (e.g., relational, network, hierarchical).
- 9.3.2.8 The methodology used to load the database must be **reported** in the **Report**.

9.3.3 Clause 3 Transaction Related Items

9.3.3.1 A statement that vendor-supplied code is functionally equivalent to **Pseudo-code** in the specification (see Clause 3.2.1.6) must be **reported** in the **Report**.

9.3.3.2 A statement that the database footprint requirements (as described in Clause 3.3) were met must be **reported** in the **Report**.

9.3.4 Clause 4 SUT, Driver, and Network Related Items

9.3.4.1 The **Network** configurations of both the **Measured** and **Priced Configurations** must be described and **reported** in the **Report**. This includes the mandatory **Network** between the **Driver** and **Tier A** (see Clause 4.2.2) and any optional **Database Server** interface networks (see Clause 4.1.3.12).

9.3.5 Clause 5 EGen Related Items

9.3.5.1 The version of **EGen** used in the benchmark must be **reported** in the **Report** (see Clause 5.3.1).

9.3.5.2 A statement that all required TPC-provided **EGen** code was used in the benchmark must be **reported** in the **Report**.

9.3.5.3 If the **Test Sponsor** modified **EGen**, a statement **EGen** has been modified must be **reported** in the **Report**. All formal waivers from the TPC documenting the allowed changes to **EGen** must also be **reported** in the **Report** (see Clause 5.3.7.1). If any of the changes to **EGen** do not have a formal waiver that must also be **reported** in the **Report**.

9.3.5.4 If the **Test Sponsor** extended **EGenLoader** (as described in Appendix A.6), the use of the extended **EGenLoader** and the audit of the extension code by an **Auditor** must be **reported** in the **Report** (see Clause 5.7.4).

9.3.5.5 The make/project files used to compile/link **EGenLoader** and **EGenValidate** must be **reported** in the **Supporting Files**. The compiler/linker options and flags used to compile/link **EGen** Objects for the **SUT** must be **reported** in the **Supporting Files**.

9.3.6 Clause 6 Performance Metrics and Response Time Related Items

9.3.6.1 The number of **EGenDriverMEE** and **EGenDriverCE** instances used in the benchmark must be **reported** in the **Report** (see Clause 6.2.5).

9.3.6.2 The **Measured Throughput** must be **reported** in the **Report** (see Clause 6.7.1.2).

9.3.6.3 A **Test Run Graph** of throughput versus elapsed wall clock time must be **reported** in the **Report** for the Trade-Result Transaction (see Clause 6.7.2).

9.3.6.4 The method used to determine that the **SUT** had reached a **Steady State** prior to commencing the **Measurement Interval** must be **reported** in the **Report**.

9.3.6.5 A description of how the work normally performed during a **Test Run**, actually occurred during the **Measurement Interval** must be **reported** in the **Report** (for example checkpointing, writing **Undo/Redo Log** records, etc.).

9.3.6.6 The recorded averages over the **Measurement Interval** for each of the **Transaction** input parameters specified by clause 6.4.1 must be **reported** in the **Report**.

9.3.7 Clause 7 Transaction and System Properties Related Items

- 9.3.7.1 The results of the **ACID** tests must be **reported** in the **Report** along with a description of how the **ACID** requirements were met, and how the **ACID** tests were run.
- 9.3.7.2 The **Test Sponsor** must **report** in the **Report** the Redundancy Level (see Clause 7.6.3.4) and describe the **Data Accessibility** test(s) used to demonstrate compliance.
- 9.3.7.3 A **Data Accessibility** Graph for each run demonstrating a Redundancy Level must be **reported** in the **Report** (see Clause 7.6.4.2).
- 9.3.7.4 The **Test Sponsor** must describe in the **Report** the test(s) used to demonstrate **Business Recovery**.

- 9.3.7.5 The **Business Recovery Time** Graph (see Clause 7.5.8.3) must be **reported** in the **Report** for all **Business Recovery** tests.

9.3.8 Clause 8 Pricing Related Items

- 9.3.8.1 Details of the **60-Day Space** computations (see Clause 6.6.6.6) along with proof that the database is configured to sustain a **Business Day** of growth (see Clause 6.6.6.1) must be **reported** in the **Report**.
- 9.3.8.2 The **Auditor's Attestation Letter**, which indicates compliance, must be included in the **Report**.

9.3.9 Supporting Files Index Table

An index for all files required by Clause 9.4 **Supporting Files** must be provided in the **Report**. The **Supporting Files** index is presented in a tabular format where the columns specify the following:

- The first column denotes the clause in the TPC Specification
- The second column provides a short description of the file contents
- The third column contains the path name for the file starting at the `SupportingFiles` directory.

If there are no **Supporting Files** provided then the description column must indicate that there is no supporting file and the path name column must be left blank.

Comment: This may be the common case for Clause 9.4.5 where **EGen** modifications are required in the **Supporting Files**.

- 9.3.9.1 The following table is an example of the **Supporting Files** Index Table that must be **reported** in the **Report**.

Clause	Description	Pathname
Introduction	Database Tunable Parameters	SupportingFiles/Introduction/DBtune.txt
	OS Tunable Parameters	SupportingFiles/Introduction/OSTune.txt
Clause 2	Table creation scripts	SupportingFiles/Clause2/createTables.sh
	Index creation scripts	SupportingFiles/Clause2/createIndex.sh
	Load Transaction Frames	SupportingFiles/Clause2/createFrames.sh
Clause 3	Broker-Volume Frames	SupportingFiles/Clause3/BrokerVolume.txt
	Trade-Order Frames	SupportingFiles/Clause3/TradeOrder.txt
	Trade-Result Frames	SupportingFiles/Clause3/TradeResult.txt
Clause 4	There are no files required to be included for Clause 4.	
Clause 5	No EGen modifications	

	No EGenLoader extensions	
	EGenDriver Configuration	SupportingFiles/Clause5/DriverConfig.txt
	EGenLoader Parameters	SupportingFiles/Clause5/LoaderParams.txt
	CCE 1 EGenLogger Output	SupportingFiles/Clause5/CCE1.out
	CCE 2 EGenLogger Output	SupportingFiles/Clause5/CCE2.out
	CMEE EGenLogger Output	SupportingFiles/Clause5/CMEE.out
Clause 6	EGenValidate Output	SupportingFiles/Clause6/Validate.out
Clause 7	ACID Scripts	SupportingFiles/Clause7/runACID.sh
	Output of ACID tests	SupportingFiles/Clause7/ACID.out
Clause 8	60-Day Space Calculations	SupportingFiles/Clause8/sixty.xls

9.4 Supporting Files

The **Supporting Files** contain human readable and machine executable (i.e., able to be performed by the appropriate program without modification) scripts that are required to recreate the benchmark **Result**. If there is a choice of using a GUI or a script, then the machine executable script must be provided in the **Supporting Files**. If no corresponding script is available for a GUI, then the **Supporting Files** must contain a detailed step by step description of how to manipulate the GUI.

The directory structure under SupportingFiles must follow the clause numbering from the TPC-E Standard Specification (i.e., this document). The directory name is specified by the 9.4 third level Clauses immediately preceding the fourth level **Supporting Files** reporting requirements. If there is more than one instance of one type of file, subfolders may be used for each instance. For example if multiple **Tier A** machines were used in the benchmark, there may be a folder for each **Tier A** machine.

File names should be chosen to indicate to the casual reader what is contained within the file. For example, if the requirement is to provide the scripts for all table definition statements and all other statements used to set-up the database, file names of 1, 2, 3, 4 or 5 are unacceptable. File names that include the text "tables", "index" or "frames" should be used to convey to the reader what is being created by the script.

9.4.1 SupportingFiles/Introduction Directory

9.4.1.1 All scripts required to configure the hardware must be **reported** in the **Supporting Files**.

9.4.1.2 All scripts required to configure the software must be **reported** in the **Supporting Files**. This includes any **Tunable Parameters** and options which have been changed from the defaults in commercially available products, including but not limited to:

- Database tuning options.
- Recovery/commit options.
- Consistency/locking options.
- **Operating System** and application configuration parameters.
- Compilation and linkage options and run-time optimizations used to create/install applications, OS, and/or databases.
- Parameters, switches or flags that can be changed to modify the behavior of the product.

Comment: This requirement can be satisfied by providing a full list of all parameters and options.

9.4.2 **SupportingFiles/Clause2** Directory

9.4.2.1 Scripts and outputs must be provided for all table definition statements and all other statements used to set-up and populate the database. All scripts must be human readable and machine executable (i.e., able to be performed by the appropriate program without modification). All scripts and outputs are to be **reported** in the **Supporting Files**.

9.4.3 **SupportingFiles/Clause3** Directory

9.4.3.1 The **Frame Implementation** (as described in Clause 4.2) of each **Transaction** must be **reported** in the **Supporting Files**. This includes, but is not limited to, the code implementing the twelve **Transactions** (see Clause 3.3) of this benchmark.

9.4.4 **SupportingFiles/Clause4** Directory

9.4.4.1 No requirements

9.4.5 **SupportingFiles/Clause5** Directory

9.4.5.1 If the **Test Sponsor** modified **EGen**, the changes must be **reported** in the **Supporting Files**.

9.4.5.2 If the **Test Sponsor** extended **EGenLoader** (as described in Appendix A.6), the extension code must be **reported** in the **Supporting Files**.

9.4.5.3 The **EGenDriverCE**, **EGenDriverMEE** and **EGenDriverDM** configuration must be **reported** in the **Supporting Files**.

9.4.5.4 The **EGenLoader** parameters used must be **reported** in the **Supporting Files**.

9.4.5.5 The **EGenLogger** output for each CCE object, CMEE object and CDM object must be **reported** in the **Supporting Files** (see Clause 5.8.1).

9.4.6 **SupportingFiles/Clause6** Directory

9.4.6.1 The output from **EGenValidate** must be **reported** in the **Supporting Files** (see Clause 6.7.4).

9.4.7 **SupportingFiles/Clause7** Directory

9.4.7.1 The **ACID** scripts and the output of the **ACID** tests must be **reported** in the **Supporting Files**.

9.4.8 **SupportingFiles/Clause8** Directory

9.4.8.1 A spreadsheet detailing the **60-Day Space** calculations must be reported in the **Supporting Files**.

CLAUSE 10 -- INDEPENDENT AUDIT

10.1 General Rules

10.1.1 Prior to its publication, a TPC-E **Result** must be reviewed by a **TPC-Certified, independent Auditor**.

Comment 1: The term **TPC-Certified** is used to indicate that the TPC has reviewed the qualification of the **Auditor** and has certified his/her ability to verify that benchmark **Results** are in compliance with this specification. (Additional details regarding the **Auditor** certification process and the audit process can be found in the TPC Policy document.)

Comment 2: The **Auditor** must be independent from the **Sponsor** in that the outcome of the benchmark carries no financial benefit to the **Auditor**, other than fees earned as a compensation for performing the audit. More specifically:

- The **Auditor** is not allowed to have supplied any performance consulting for the benchmark under audit.
- The **Auditor** is not allowed to be financially related to the **Sponsor** or to any one of the suppliers of a measured/priced component (e.g., the **Auditor** cannot be an employee of an entity owned wholly or in part by the **Sponsor** or by the supplier of a benchmarked component, and the **Auditor** cannot own a significant share of stocks from the **Sponsor** or from the supplier of any benchmarked component, etc.)

10.1.2 All audit requirements specified in the version of the TPC Pricing Specification, located at www.tpc.org must be followed. For clarity and readability the TPC Pricing Specification requirements may be repeated in the TPC-E Specification.

10.1.3 When the optional TPC-Energy standard is used, the additional audit requirements must be followed. In addition, the requirements of the TPC-Energy Specification, located at www.tpc.org, must be met.

10.1.4 A generic audit checklist is provided as part of this specification. The **Auditor** may choose to provide the **Sponsor** with additional details on the TPC-E audit process.

10.1.5 The generic audit checklist specifies the TPC-E requirements that should be checked to ensure a TPC-E **Result** is compliant with the TPC-E Specification. The TPC-E requirements may also be required to be **reported** in the **FDR**. Not only should the TPC-E requirement be checked for accuracy but the **Auditor** must ensure that the **FDR** accurately reflects the audited **Result**. For example, if the audit checklist indicates to "verify that a **Business Recovery Time** Graph is generated as specified", the graph must be verified to be accurate and verified to be the same graph that is **reported** in the **FDR** as specified by Clause 9.3.7.5.

10.1.6 The **Auditor's** opinion regarding the compliance of a **Result** must be consigned in an **Attestation Letter** delivered directly to the **Sponsor**. To document that a **Result** has been audited, the **Attestation Letter** must be included in the **Report** and made readily available to the public. Upon request, and after approval from the **Sponsor**, a detailed audit report may be produced by the **Auditor**.

10.1.7 The scope of the audit is limited to the functions defined in this specification. The ability to perform arbitrary functions against the **SUT** (e.g., executing **Transactions** unrelated to those defined in Clause 3.3, generating input data unrelated to those produced by the **CE** and the **MEE**, creating data structures unrelated to those necessary to implement Clause 2, etc.) is outside of the scope of the audit.

10.1.8 A **Sponsor** can demonstrate compliance of a new **Result** produced without running any performance test by referring to the **Attestation Letter** of another **Result**, if the following conditions are all met:

- The referenced **Result** has already been published by the same or by another **Sponsor**.
- The new **Result** must have the same hardware and software architecture and configuration as the referenced **Result**. The only exceptions allowed are for elements not involved in the processing logic of the SUT (e.g., number of peripheral slots, power supply, cabinetry, fans, etc.)
- The **Sponsor** of the already published **Result** gives written approval for its use as referenced by the **Sponsor** of the new **Result**.
- The **Auditor** verifies that there are no significant functional differences between the priced components used for both **Results** (i.e., differences are limited to labeling, packaging and pricing.)
- The **Auditor** reviews the **FDR** of the new **Result** for compliance. The **Auditor** delivers a new **Attestation Letter** to be included in the **Report** of the new **Result**.

Comment 1: The intent of this clause is to allow publication of benchmarks for systems with different packaging and model numbers that are considered to be identical using the same benchmark run. For example, a rack mountable system and a freestanding system with identical electronics can use the same **Test Run** for publication, with, appropriate changes in pricing.

Comment 2: Although it should be apparent to a careful reader that the **FDR** for the two **Results** are based on the same set of performance tests, the **FDR** for the new **Result** is not required to explicitly state that it is based on the performance tests of another published **Result**.

Comment 3: When more than one **Result** is published based on the same set of performance tests, only one of the **Results** from this group can occupy a numbered slot in each of the benchmark **Result** "Top Ten" lists published by the TPC. The **Sponsors** of this group of **Results** must all agree on which **Result** from the group will occupy the single slot. In case of disagreement among the **Sponsors**, the decision will be made by the **Sponsor** of the earliest publication from the group.

10.2 Auditing the Database

The **Auditor** must verify that the implementation of the measured database meets the TPC-E Specification requirements. The **Auditor** may require the review of any and all source code and associated scripts or programs used to create and populate the database. The **Auditor** can require additional database verification not specified in the TPC-E Specification to ensure the validity of the database.

10.2.1 Schema Related Items

- 10.2.1.1 Verify that the data types used to implement the columns of the TPC-E required tables meet the requirements from Clause 2.2.1.
- 10.2.1.2 Verify that the data Meta-types used to implement the columns of the TPC-E required tables meet the requirements of Clause 2.2.2.
- 10.2.1.3 Verify that the 9 tables in the Customer set have all of the required properties (see Clause 2.2.4).
- 10.2.1.4 Verify that the 9 tables in the Broker set have all of the required properties (see Clause 2.2.5).
- 10.2.1.5 Verify that the 11 tables in the Market set have all of the required properties (see Clause 2.2.6).
- 10.2.1.6 Verify that the 4 tables in the Dimension set have all of the required properties (see Clause 2.2.7).
- 10.2.1.7 Verify that all **Primary Keys**, all **Foreign Keys**, and all check constraints specified are maintained by the database (see Clause 2.2.3).

- 10.2.1.8 Verify that all copies of any replicated table, if used, meet all requirements for atomicity, consistency, and isolation. Verify that at least one copy of any replicated TPC-E table meets **Durability** requirements (see Clause 2.3.4).
- 10.2.1.9 Verify that adding or duplicating any columns from one TPC-E table to another does not result in a performance improvement (see Clause 2.3.5).
- 10.2.1.10 Verify that all table columns are logically discrete (see Clause 2.3.6).
- 10.2.1.11 Verify that all table columns are accessible by the data manager as a single column (see Clause 2.3.7).
- 10.2.1.12 Verify that **Primary Keys** are not a direct representation of the physical disk addresses of the row (see Clause 2.3.8).
- 10.2.1.13 Verify that BLOB columns are implemented with the required properties (see Clause 2.3.10).
- 10.2.1.14 Verify that the implementation of the database satisfies the integrity rules (see Clause 2.4).
Comment: A check for the condition in clause 2.4.2 is not required, but the requirement still exists.

- 10.2.1.15 Verify that the implementation of the database satisfies the data access transparency requirements (see Clause 2.5).

10.2.2 Population Related Items

- 10.2.2.1 Verify that the version of **EGenLoader** used is compliant with the current version of the TPC-E specification (see Clause 5.7.1).
- 10.2.2.2 Verify that none of the **EGenLogger** output contains "NO". A "NO" indicates that the associated **EGenDriver** or **EGenLoader** configuration parameter is not compliant with the current TPC-E Specification (see Clause 5.2.9).
- 10.2.2.3 Verify that the database is populated using data generated by **EGenLoader** (see Clause 2.6.1.1).
- 10.2.2.4 Verify that the database is populated with an integral number of **Load Units** (see Clause 2.6.1.2).
- 10.2.2.5 Verify that the initial database population consists of a number of **Business Days** equal to **ITD** (see Clause 2.6.1.5).
- 10.2.2.6 Verify that the cardinality of the TPC-E required tables in the initially populated database meets the requirements of Clause 2.6.1.
- 10.2.2.7 Verify that each non-Growing Table can grow by a number of rows equal to at least 5% of the table cardinality (see Clause 2.3.9).

10.3 Auditing the Transactions

The **Auditor** must verify that the implementation of the **Transactions** meets the TPC-E Specification requirements. The **Auditor** may require the review of any and all source code and associated scripts or programs for the **Transactions**. The **Auditor** can require additional **Transaction** verification not specified in the TPC-E Specification to ensure the validity of the **Transactions**.

- 10.3.1 Verify that the implementation of each **Transaction** specified in Clause 3.3 is compliant with its respective input parameters, output parameters, **Database Footprint** and **Frame Implementation** requirements. More specifically:
- Verify that the Broker-Volume **Transaction** is compliant with the requirements defined in Clause 3.3.1.
 - Verify that the Customer-Position **Transaction** is compliant with the requirements defined in Clause 3.3.2.
 - Verify that the Market-Feed **Transaction** is compliant with the requirements defined in Clause 3.3.3.
 - Verify that the Market-Watch **Transaction** is compliant with the requirements defined in Clause 3.3.4.
 - Verify that the Security-Detail **Transaction** is compliant with the requirements defined in Clause 3.3.5.
 - Verify that the Trade-Lookup **Transaction** is compliant with the requirements defined in Clause 3.3.6.
 - Verify that the Trade-Order **Transaction** is compliant with the requirements defined in Clause 3.3.7.
 - Verify that the Trade-Result **Transaction** is compliant with the requirements defined in Clause 3.3.8.
 - Verify that the Trade-Status **Transaction** is compliant with the requirements defined in Clause 3.3.9.
 - Verify that the Trade-Update **Transaction** is compliant with the requirements defined in Clause 3.3.10.
 - Verify that the Data-Maintenance **Transaction** is compliant with the requirements defined in Clause 3.3.11.
 - Verify that the Trade-Cleanup **Transaction** is compliant with the requirements defined in Clause 3.3.12.
- 10.3.2 Verify that all **Frames** are implemented without circumventing any specified database references to static or infrequently changing data elements (see Clause 3.2.1.1).
- 10.3.3 Verify that **Frames** do not exchange data outside of the specified input and output parameters used to communicate with the **EGenTxnHarness** (see Clause 3.2.1.3).
- 10.3.4 Verify that implementation of each **Frame** is functionally equivalent to the **Pseudo-code** provided for that **Frame** in Clause 3.3.
- 10.3.5 Verify that the **Frame Implementation** correctly sets null indicator variables in **EGenTxnHarness** structures.

10.4 Auditing the SUT, Driver and Networks

The **Auditor** must verify that the implementation of the test environment meets the TPC-E Specification requirements. The **Auditor** may require the review of any and all source code implementing the various components involved and associated scripts or programs. The **Auditor** can require additional verification not specified in the TPC-E Specification to ensure the validity of the test environment.

- 10.4.1 Verify that the format of the data provided to the **EGenDriver Connector** and the **EGenTxnHarness Connector** is not modified, except as permitted (see Clause 4.1.3.14).

- 10.4.2 Verify the **Sponsor** written code meets the requirement of Clause 4.4.1.1.
- 10.4.3 Verify that the “no-peeking-in-the-packet” rule is followed (see Clause 4.4.1.3).
- 10.4.4 Verify that the **Driver** meets the requirements of Clause 4.4.1.4.
- 10.4.5 Verify that the **SUT** meets the requirements of Clause 4.4.1.5
- 10.4.6 Verify that any routing within a **Frame Implementation** meets the requirements of Clause 4.4.1.6.
- 10.4.7 Verify the presence and use of a **Network** to communicate between the **Driver** and **Tier A** (see Clause 4.2.2).
- 10.4.8 Verify that the restrictions on operator interventions are met (see Clause 4.4.3).

10.5 Auditing EGen

- 10.5.1 Verify that the version of **EGen** used is compliant with the version of the TPC-E specification used for publication (see Clause 5.3).
 - Verify that the **EGenSourceFiles** used have not been modified (see Clause 5.6).
 - If the **Test Sponsor** modified **EGen** in response to a formal waiver issued by the TPC, verify that the changes fall under the scope of the waiver (see Clause 5.3.7).
 - If the **Test Sponsor** modified **EGen** outside of an existing TPC waiver, review the changes to verify that it was done for the exclusive purpose of correcting a newly discovered error in **EGen** (see Clause 5.3.6).
- 10.5.2 Verify that the requirements in Clause 5.3.5 are satisfied.
- 10.5.3 Verify that modifications or extensions made by the **Sponsor** to **EGenLoader** do not compromise the values for the data generated by **EGenLoader** (see Clause 5.7.4).
- 10.5.4 Verify that the **CE** is implemented using the **EGenDriverCE** (see Clause 5.8.5).
- 10.5.5 If an Asynchronous CE Driver Architecture was used, verify that the CE Driver meets the requirements of Clause 6.2.3.1.
- 10.5.6 Verify that the **MEE** is implemented using **EGenDriverMEE** (see Clause 5.8.6).
- 10.5.7 Verify that the Data-Maintenance **Transaction** is implemented using **EGenDriverDM** (see Clause 5.8.7).
- 10.5.8 Verify that the implementation uses **EGenTxnHarness** (see clause 5.9.1).
- 10.5.9 Verify that the contents of the **EGenInputFiles** used are for the correct version of **EGen** used, that they have not been modified, and that all copies of the **EGenInputFiles** are identical and used in all **EGenLoader** and **Driver** instances (see Clause 5.8.4).

10.6 Auditing the Execution Rules and Metrics

The **Auditor** must verify that all TPC-E execution rules have been followed by the **Test Sponsor**. The **Auditor** may require the review of any and all output of the benchmark environment. The **Auditor** can require additional verification not specified in the TPC-E Specification to ensure the validity of the Benchmark Execution Rules and the resulting **Reported Throughput**.

10.6.1 Pre-run Configuration Items

- 10.6.1.1 Verify that the contents of the database meet the requirements of Clause 6.6.2.1 and Clause 6.6.2.3.
- 10.6.1.2 Verify that the Trade-Cleanup **Transaction** was executed prior to the start of the **Test Run** or that the database was in its initially populated state (e.g., verify that the final TRADE count minus the number of Trade-Orders completed by the **Driver** during the **Test Run** is equal to the initial TRADE count) (see Clause 6.6.2.2).
- 10.6.1.3 Verify that no executions of the Trade-Cleanup **Transaction** occur during the **Test Run** (see Clause 6.6.1.1).
- 10.6.1.4 Verify that the system clocks are synchronized as required by Clause 4.4.4.

10.6.2 Runtime Configuration Items

- 10.6.2.1 Verify that, for specific global inputs, each instance of the **CE**, **DM** and the **MEE** is using the same values as those used by the **EGenLoader** instances during the initial database population (see Clause 5.8.4). This requirement applies to the following global inputs:
 - The contents of each flat_in file.
 - The value for **Scale Factor (SF)**.
 - The number of **Initial Trade Days**.
 - The number of **Configured Customers**.
- 10.6.2.2 Verify that none of the **EGenLogger** output contains “NO”. A “NO” indicates that the associated **EGenDriver** or **EGenLoader** configuration parameter is not compliant with the current TPC-E Specification (see Clause 5.2.9).
- 10.6.2.3 If an Asynchronous CE Driver Architecture was used, verify that the CE Driver meets the requirements of Clause 6.2.3.1.

10.6.3 Runtime Data Generation Items

- 10.6.3.1 Verify that the **reported Transaction Mix** over the **Measurement Interval** only counts **Valid Transactions** (see Clause 6.3).
- 10.6.3.2 Verify that the **reported Transaction Mix** over the **Measurement Interval** excludes the Data-Maintenance **Transactions** (see Clause 6.3.1).
- 10.6.3.3 Verify that the specified mix of **Transactions** over the **Measurement Interval** meets the requirements (see Clause 6.3.1).
- 10.6.3.4 Verify that the **reported Transaction Mix** over the **Measurement Interval** is computed and **reported** with the required precision and rounding (see Clause 6.3.2).

- 10.6.3.5 Verify that the **CE Driver** generated input data with a random variability that stays within the specified ranges (see Clause 6.4.1).
- 10.6.3.6 Verify that the number of **Load Units** configured for the database is equal to the number of **Load Units** actually accessed during the **Test Run** (see Clauses 2.6.1.6 and 6.6.8.5).

10.6.4 **Response Time Items**

- 10.6.4.1 Verify that the **Transaction Response Times** meet the requirements of Clause 6.5.1.2.
- 10.6.4.2 Verify for each type of Transaction that its average **Response Times** does not exceed its 90th percentile **Response Time** (see Clause 6.5.1.4).
- 10.6.4.3 Verify that the **Dispatch Time** meets the requirements of Clause 6.5.2.

10.6.5 **C_ID Partitioning Items**

- 10.6.5.1 If **C_ID** partitioning was used, verify that the **CE Driver** meets the requirements of Clause 6.4.2.1.
- 10.6.5.2 If **C_ID** partitioning was used, verify that the **Measurement Interval** meets the requirements in Clause 6.4.2.2.

10.6.6 **Throughput Items**

- 10.6.6.1 Verify the **Measured Throughput** is between 80% and 102% of the **Nominal Throughput** (see Clause 6.7.1.2).
- 10.6.6.2 Verify that the **Reported Throughput** is not greater than the **Nominal Throughput** (see Clause 6.7.1).

10.6.7 **Data-Maintenance Items**

- 10.6.7.1 Verify that one, and only one, Data-Maintenance **Transaction** generator is used during the **Test Run** (see Clause 5.8.7.2).
- 10.6.7.2 Verify that during the **Measurement Interval** the Data-Maintenance **Transaction** is invoked every 60 seconds and completes within no more than 55 seconds (see Clause 6.3.3).
- 10.6.7.3 Verify that the Data-Maintenance **Transaction** modified the rows specified in Clause 3.3.11.

10.6.8 **Steady State Items**

- 10.6.8.1 Verify that the **Steady State** meets the requirements of **Sustainable** performance as specified by Clause 6.6.3.
- 10.6.8.2 Verify that all events performed at regular intervals during **Steady State** are present before and during the **Measurement Interval** as required (see Clause 6.6.4.1) and that the duration of **Steady State** meets all the requirements listed in Clause 6.6.4.2.
- 10.6.8.3 Verify that the **Measurement Interval** meets all the requirements of Clause 6.6.5.

10.6.9 **EGenValidate Items**

- 10.6.9.1 Verify that output from **EGenValidate** indicates "Passed!" (see Clause 6.7.4).

10.6.10 Space Calculation Items

- 10.6.10.1 Verify that the **Data Growth** is computed as specified and that sufficient space to accommodate it is available on-line (see Clause 6.6.6).

10.7 Auditing the ACID Tests

The **Auditor** must verify that the implementation of the **ACID** tests sufficiently demonstrates compliance with the TPC-E **ACID** requirements. The **Auditor** may require the review the source code implementing these tests and any associated scripts or programs. The **Auditor** can require additional verification not specified in the TPC-E Specification to ensure the validity of the **ACID** tests.

- 10.7.1 Verify that all copies of any replicated table, if used, meet all requirements for atomicity, consistency, and isolation. Verify that at least one copy of any replicated TPC-E table meets **Durability** requirements (see Clause 2.3.4).

10.7.2 Atomicity Items

- 10.7.2.1 Verify that the atomicity test is implemented as specified in Clause 7.2.2.

- 10.7.2.2 Verify that the atomicity test correctly demonstrates the atomicity property (see Clause 7.2.1).

10.7.3 Consistency Items

- 10.7.3.1 Verify that the consistency tests are implemented as specified in Clause 7.3.3.

- 10.7.3.2 Verify that the consistency conditions are successfully demonstrated by the tests (see Clause 7.3.2)

10.7.4 Isolation Items

- 10.7.4.1 Verify that the isolation tests are implemented as specified in Clause 7.4.2.

- 10.7.4.2 Verify that the isolation tests correctly demonstrate the isolation requirements (see Clause 7.4.1.3).

10.7.5 Data Accessibility Items

- 10.7.5.1 Verify that the **Durability** tests for **Data Accessibility** are implemented as specified (see Clause 7.6.3.5).

- 10.7.5.2 Verify that the Redundancy Level chosen by the **Sponsor** is successfully demonstrated by the **Data Accessibility** test (see Clause 7.6.3.5).

- 10.7.5.3 Verify that the Redundancy Level chosen by the **Sponsor** is correctly **reported** in the **Report** (see Clause 7.6.3.4).

- 10.7.5.4 Verify that a **Data Accessibility** Graph is generated as specified in Clause 7.6.4.2.

10.7.6 Business Recovery Items

- 10.7.6.1 Verify that the **Durability** tests for **Business Recovery** are implemented as specified (see Clause 7.5.7).

- 10.7.6.2 Verify that recovery from each required single failure scenario is successfully demonstrated by one or more **Business Recovery** tests (see Clause 7.5.7).

- 10.7.6.3 Verify that the **Business Recovery Time** correctly measures the time between the start of **Business Recovery** and the end of **Business Recovery** (see Clause 7.5.6.10).
- 10.7.6.4 Verify that a **Business Recovery Graph** is generated as specified in Clause 7.5.8.3.

10.8 Auditing the Pricing

- 10.8.1 Rules for auditing Pricing information are specified in the effective version of the TPC Pricing Specification, located at [www\(tpc.org](http://www(tpc.org)).
- 10.8.2 Verify that the greater of the **60-Day Space** or the data storage configured during the measurement is included in the **Priced Configuration** (see Clause 8.2).
- 10.8.3 Verify that additional operational components or additional software that might be customary on a customer installed configuration or might be necessary to build and run the **Application** are included (see Clause 8.3.1 and Clause 8.3.2).
- 10.8.4 Verify that all component **Substitutions** are compliant with the TPC Pricing Specification and with the TPC-E specific restrictions (see Clause 8.4).

10.9 Auditing the FDR

For the Audit requirements specified in Clauses 10.5 through 10.8, the **Auditor** must ensure that if required by Clause 9, the items, requirements or values are correctly **reported** in the **FDR**.

For those items, requirements or values that are **reported** in the **FDR** and not required to be audited, the **Auditor** need only ensure that they are in the **FDR** and appear to be reasonable. For example, the **Auditor** can not be held responsible for accuracy of the **Availability Date** but can ensure that it is **reported** in the **FDR** and does not fall outside the 6 month availability window starting from the publication date.

- 10.9.1 Verify that table partitioning, if used, meets the requirements from Clauses 2.3.3.
- 10.9.2 Verify that the **reported Transaction Mix** over the **Measurement Interval** is computed and **reported** with the required precision and rounding (see Clause 6.3.2).
- 10.9.3 Verify that the **Reported Test Run Graph** meets the requirements (see Clause 6.7.2).
- 10.9.4 Verify that the **Executive Summary Statement** is accurate and complies with the reporting requirements as specified in Clause 9.2.
- 10.9.5 For those items which are required by Clause 9.3 to be **reported** in the **Report** and are also required by Clauses 10.5 through 10.8 to be verified by the **Auditor**, verify that the items are accurately **reported** in the **Report**. For those items which are required to be **reported** by Clause 9.3 but are not required to be verified by the **Auditor**, ensure that the items are **reported** in the **Report** and appear to be reasonable.
- 10.9.6 Verify that the **Supporting Files** specified by Clause 9.4 exist and appear to be reasonable.
- 10.9.7 Verify that the following sections of the FDR are accurate:
 - Verify that the diagram illustrating the **Measured Configuration** is accurate (see Clause 9.3.1.2)
 - Verify that the diagram illustrating the **Priced Configuration** is accurate (see Clause 9.3.1.2)

- Verify that the textual descriptions required by Clause 9.3.2 are accurate.
 - Verify that any **EGen** changes made by the **Sponsor** are **reported** in detail in the **FDR** (see Clause 9.3.5.3).
 - Verify that modifications or extensions made by the **Sponsor** to **EGenLoader** are documented in sufficient detail in the **Report** and that the code for the modification or extension is **reported** in the **Supporting Files** (see Clause 9.3.5.4).
- 10.9.8 A complete review of the **Report** by the **Auditor**, beyond the sections listed above, can be requested by the **Sponsor**, but is not required.

Appendix A. EGEN USER'S GUIDE

A.1 Overview

EGen is a TPC provided software package. It is designed to facilitate the implementation of TPC-E. This appendix provides information on how a **Test Sponsor** is to use the features and functionality of **EGen**. The definitions, descriptions, constraints and regulations governing the use of **EGen** are captured in Clause 5 -- .

Comment: Some of the following sections assume the reader has a good understanding of object-oriented design and programming techniques using ANSI C++.

A.2 EGen Directory

A.2.1 **EGen** is distributed in a single directory hierarchy. The following diagram shows the overall **EGen** directory hierarchy.

Figure A.a - Hierarchy of EGen Directory

- bin – default target directory for executable binary files
- flat_in - contains flat input files
- flat_out - default target directory for flat file output
- inc - contains header files
- inc/win - Windows specific header files
- lib - default target directory for library files
- obj - default target directory for object files
- prj - contains project files
- src - contains source files
- src/win - Windows specific source files

A.3 EGenProjectFiles

A.3.1 **EGenProjectFiles** are located in the **EGen/prj** directory. These files can be used to facilitate building **EGen** components in various environments.

- Windows

A set of Visual Studio 2003 files are provided. EGen.sln is the top level solution file and brings in all of the necessary .prj files.

- U*x

A make file (makefile) is provided to facilitate building the **EGen** components using a make utility. The makefile is known to work with GNU make, but other flavors of make may require some editing of the makefile.

A.4 **EGenInputFiles**

A.4.1 **EGenInputFiles** are located in the EGen/flat_in directory. These files are text files containing rows of tab-separated data. The files are used by **EGenLoader** to create the data to populate the database and by **EGenDriver** components to generate valid input for **Transactions**. The generated data is based on knowing the contents of the input files ("raw" material) and the overall scaling factors (**Scale Factor**, **Configured Customers**, **Initial Trade Days**).

A.5 **EGenSourceFiles**

A.5.1 **EGenSourceFiles** are located in EGen/inc, EGen/src and their associated sub-directories.

A.5.2 **EGenSourceFiles** contain TPC-provided ANSI C++ code to be used in a compliant TPC-E implementation. Functionality is provided to facilitate:

- population of a TPC-E compliant database
- implementation of a TPC-E compliant environment

This functionality is described in subsequent sections.

A.6 **EGenLoader**

A.6.1 The task of populating a compliant TPC-E database can be broken into two parts:

- generating compliant data records
- loading the records into the database

Comment: The **Sponsor** is responsible for coming up with scripts to create the database and tables and to apply the required constraints.

A.6.2 Data generation is a **DBMS**-neutral task, whereas database population is obviously very **DBMS**-specific. Therefore, **EGenLoader** is architected honoring this separation as follows. **EGenSourceFiles** contain class definitions that provide abstractions of the TPC-E tables. These table classes are known collectively as **EGenTables** and they encapsulate the functionality needed to generate the data for each of the TPC-E tables. Many of the classes in **EGenTables** are dependent on **EGenInputFiles** for “raw material” used in data record generation. **EGenLoader** therefore makes **EGenInputFiles** available to **EGenTables**, and uses **EGenTables** to generate TPC-E compliant data records.

A.6.3 In order to support the **DBMS**-specific nature of loading the generated data, **EGenLoader** makes use of a virtual base class **CBaseLoader** to “load” the data. This provides a controlled interface from the **DBMS**-neutral data generation portion of **EGenLoader** to the **DBMS**-specific data loading portion of **EGenLoader**. **DBMS**-specific code is encapsulated in subclasses that inherit from and provide an implementation of the virtual **CBaseLoader** class. (**Note:** **CBaseLoader** is actually a template, where the one template parameter is the row type corresponding to the particular TPC-E table being loaded.) **EGenLoader** provides two alternative implementations of **CBaseLoader**.

A.6.4 The first loader functionality provided by **EGenLoader** doesn’t actually load a database directly, but rather produces output flat files. One text file is produced for each TPC-E table. These files contain rows of data values, where the data values are separated by “|”. To use this functionality, define the compile-time variable **COMPILE_FLAT_FILE_LOAD** when building **EGenLoader** and use the “-l FLAT” switch when running **EGenLoader**.

This mode of loader functionality is designed to work with bulk-loader tools which populate a database with the contents of a set of flat files. Due to variations in the expected format of certain data types, it is possible to configure **EGenLoader** via compile-time variables to change the format of certain data types in the output flat files. The data types, compile-time variables and possible values are listed in the following table:

Data Type	Compile-Time #define	Possible Values
DATETIME	DATETIME_FORMAT	See CDatetime::ToStr() in src/DateTime.cpp
DATE	DATE_FORMAT	See CDatetime::ToStr() in src/DateTime.cpp
TIME	TIME_FORMAT	See CDatetime::ToStr() in src/DateTime.cpp
BOOLEAN	BOOLEAN_TRUE	Any string constant representing a TRUE Boolean value. String constants must be quoted.
BOOLEAN	BOOLEAN_FALSE	Any string constant representing a FALSE Boolean value. String constants must be quoted.

- A.6.5 The second loader functionality provided by **EGenLoader** is for direct loading of a Microsoft SQL Server database via the ODBC interface. To use this functionality define the compile-time variable COMPILE_ODBC_LOAD when building **EGenLoader** and use the “-l ODBC” switch when running **EGenLoader**.
- A.6.6 **EGenLoader** can be extended by providing an implementation of the CBaseLoader template class in a sub-class named CCustomeLoader. To used this functionality define the compile-time variable COMPILE_CUSTOM_LOAD and link with **Sponsor**-provided code that implements the CCustomeLoader class when building **EGenLoader**, and use the “-p” option to pass parameters to the custom loader.
- A.6.7 A full listing of **EGenLoader** switches can be seen by building **EGenLoader** using **EGenProjectFiles** and then running **EGenLoader** with the “-?” switch.

A.7 **EGenDriver**

- A.7.1 A TPC-E Test **Sponsor** is responsible for implementing a compliant TPC-E **Driver** (Clause 4 --). The TPC provides **EGenDriver** to facilitate implementation of a compliant **Driver** and to standardize certain key platform-independent parts of the **Driver**.
- A.7.2 **EGenDriver** comprises the following three parts.
- **EGenDriverCE** – any and/or all instantiations of the CCE class (see **EGenSourceFiles** CE.h and CE.cpp).
 - **EGenDriverMEE** – any and/or all instantiations of the CMEE class (see **EGenSourceFiles** MEE.h and MEE.cpp).
 - **EGenDriverDM** – the single instantiation of the CDM class (see **EGenSourceFiles** DM.h and DM.cpp).

- A.7.3 **EGenDriver**, like **EGenLoader**, makes use of **EGenInputFiles** and **EGenTables** in data generation. This provides data generation coherency between database population time and **Test Run** time.
- A.7.4 The **Sponsor** is responsible for providing a suitable implementation of the **Trade-Cleanup Transaction** (see Clause 3.3.12). Trade-Cleanup may be implemented as a separate, standalone procedure or as part of **EGenDriverDM**.

A.8 **EGenLogger**

- A.8.1 **EGenLogger** is used by **EGenDriver** and **EGenLoader** to log their configuration and any re-configuration. Although not strictly required, the **Test Sponsor** is expected to override/provide a `SendToLoggerImpl` implementation for recording **EGenLogger's** output. For details see `EGen/inc/EGenLogger.h`.

A.9 **Implementing a CE using EGenDriverCE**

- A.9.1 Sending data to and receiving data from the **SUT** is very platform-specific functionality. Its implementation depends on the underlying communication protocol and hardware used. Likewise, measuring the **Transaction's Response Time** is also platform-specific – depending on what timing mechanisms are provided by the underlying software and hardware.

However, the **Transaction Mix** (deciding which **Transaction** to perform next) and generating the **Transaction** input data is very platform-neutral. Therefore, **EGenDriverCE** encapsulates this functionality and provides a standardized implementation for it across all TPC-E implementations.

A.10 **Implementing a MEE using EGenDriverMEE**

- A.10.1 Sending data to and receiving data from the **SUT** is very platform-specific functionality. Its implementation depends on the underlying communication protocol and hardware used. Likewise, measuring the **Transaction's Response Time** is also platform-specific – depending on what timing mechanisms are provided by the underlying software and hardware.

However, emulating the internal stock exchange functionality, and generating the **Transaction** input data for Trade-Result and Market-Feed is very platform-neutral. Therefore, **EGenDriverMEE** encapsulates this functionality and provides a standardized implementation for it across all TPC-E implementations.

Comment: A proper **MEE** implementation must be able to adjust to changing rates of trade requests and be able to turn-around trade requests into new Trade-Result **Transactions** in a timely fashion. Similarly, a proper **MEE** implementation must be able to adjust to changing rates of Trade-Results and must initiate Market-Feed **Transactions** in a timely fashion.

A.11 Implementing a Data-Maintenance Generator using EGenDriverDM

A.11.1 Sending data to and receiving data from the SUT is very platform-specific functionality. Its implementation depends on the underlying communication protocol and hardware used. Likewise, measuring the Data-Maintenance **Transaction's Response Time** is also platform-specific – depending on what timing mechanisms are provided by the underlying software and hardware.

However, generating the **Transaction** input data for the Data-Maintenance **Transaction** is very platform-neutral. Therefore, **EGenDriverDM** encapsulates this functionality and provides a standardized implementation for it across all TPC-E implementations.

A.12 EGenTxnHarness

EGenTxnHarness comprises any and/or all instantiations of:

- CBrokerVolume class excluding the **Sponsor** provided implementation of CBrokerVolumeDBInterface (see **EGenSourceFile TxnHarnessBrokerVolume.h**)
- CCustomerPosition class excluding the **Sponsor** provided implementation of CCustomerPositionDBInterface (see **EGenSourceFile TxnHarnessCustomerPosition.h**)
- CDatamaintenance class excluding the **Sponsor** provided implementation of CDatamaintenanceDBInterface (see **EGenSourceFile TxnHarnessDataMaintenance.h**)
- CMarketFeed class excluding the **Sponsor** provided implementation of CMarketFeedDBInterface (see **EGenSourceFile TxnHarnessMarketFeed.h**)
- CMarketWatch class excluding the **Sponsor** provided implementation of CMarketWatchDBInterface (see **EGenSourceFile TxnHarnessMarketWatch.h**)
- CSecurityDetail class excluding the **Sponsor** provided implementation of CSecurityDetailDBInterface (see **EGenSourceFile TxnHarnessSecurityDetail.h**)
- CTradeCleanup class excluding the **Sponsor** provided implementation of CTradeCleanupDBInterface (see **EGenSourceFile TxnHarnessTradeCleanup.h**)
- CTradeLookup class excluding the **Sponsor** provided implementation of CTradeLookupDBInterface (see **EGenSourceFile TxnHarnessTradeLookup.h**)
- CTradeOrder class excluding the **Sponsor** provided implementation of CTradeOrderDBInterface (see **EGenSourceFile TxnHarnessTradeOrder.h**)
- CTradeResult class excluding the **Sponsor** provided implementation of CTradeResultDBInterface (see **EGenSourceFile TxnHarnessTradeResult.h**)
- CTradeStatus class excluding the **Sponsor** provided implementation of CTradeStatusDBInterface (see **EGenSourceFile TxnHarnessTradeStatus.h**)
- CTradeUpdate class excluding the **Sponsor** provided implementation of CTradeUpdateDBInterface (see **EGenSourceFile TxnHarnessTradeUpdate.h**)

A.13 Functional Implementation

The following diagram gives a high level overview of a sample implementation of the TPC-E environment. A number of details have been omitted for clarity.

Figure A.b - High Level Overview of a Sample Implementation

In the diagram above,

- dotted “lines” with arrows between TPC Provided objects represent input parameters
 - dotted “lines” without arrows between TPC Provided objects represent input files from **EGenInputFiles**
 - Solid “lines” with arrows are calls
1. The **Test Sponsor** is responsible for implementing a **Customer Emulator** per Clauses 5.8.5 and A.8.
 - a. CInputFiles is a class provided as part of **EGen** used for loading into memory the **EGenInputFiles** used by other classes in **EGen**. The **Test Sponsor** is responsible for instantiating a CInputFile object correctly and passing a pointer to it into the CCE constructor. See EGen/inc/InputFlatFilesStructure.h.
 - b. TParameterSettings is a TPC provided structure that can be used to alter the behavior of **EGenDriver**. Use of this structure for a compliant run is not required; it is provided to facilitate prototyping and engineering work. See EGen/inc/DriverParamSettings.h.
 - c. CCESUTInterface is a TPC provided pure virtual class that defines an interface used by the CCE class. It is the **Sponsor’s** responsibility to subclass CCESUTInterface and provide the necessary implementation. This implementation is responsible for sending a **Transaction** request to the **SUT**, measuring the **Transaction’s Response Time** and logging all necessary data. A pointer to the **Sponsor’s** implementation of the CCESUTInterface must be passed into the CCE constructor. See EGen/inc/CESUTInterface.h.
 - d. CCE is a TPC provided class that must be used when implementing a **Customer Emulator**. It is the **Sponsor’s** responsibility to provide pointers to a CInputFile object and CCESUTInterface object when constructing the CCE object. The process of running a test is effectively looping around a call to CCE::DoTxn(). When DoTxn() is called, the CCE object will determine which **Transaction** to perform, generate the necessary input data for the **Transaction** and pass that data to the **Sponsor’s** implementation of CCESUTInterface for execution. See EGen/inc/CE.h.
 2. The **Test Sponsor** is responsible for implementing a **Market Exchange Emulator** per Clauses 5.8.6 and A.10.
 - a. CSecurityFile is a class provided as part of **EGen** used for loading EGen/flat_in/SecurityFile.txt into memory. The **Test Sponsor** is responsible for instantiating a CS defense SecurityFile object and passing a pointer to it into the CMEE constructor. See EGen/inc/SecurityFile.h.
 - b. CMEESUTInterface is a TPC provided pure virtual class that defines an interface used by the CMEE class. It is the **Sponsor’s** responsibility to subclass CMEESUTInterface and provide the necessary implementation. This implementation is responsible for sending a **Transaction** request to the **SUT**, measuring the **Transaction’s Response Time** and logging all necessary data. A pointer to the **Sponsor’s** implementation of the CMEESUTInterface must be passed into the CMEE constructor. See EGen/inc/MEESUTInterface.h.
 - c. CMEE is a TPC provided class that must be used when implementing a **Market Exchange Emulator**. It is the **Sponsor’s** responsibility to provide pointers to a CS defense SecurityFile object and CMEESUTInterface object when constructing the CMEE object. During a **Test Run**, the **Sponsor’s Market Exchange Emulator** is responsible for accepting requests from the **Sponsor’s** SendToMarket implementation running on the **SUT** and passing these requests to the CMEE object via SubmitTradeRequest(). In addition, the **Sponsor’s Market Exchange Emulator** is responsible for keeping a timer and calling CMEE::GenerateTradeResult() as necessary. See EGen/inc/MEE.h.

- The **Test Sponsor** is responsible for implementing functionality on the **SUT** to accept **Transaction** request over a network connection from the **Sponsor's** CCESUTInterface and CMEESUTInterface implementations. Note that the diagram depicts individual network connections for each **Transaction** type but the **Sponsor** is free to implement a single connection capable of handling any/all types of **Transactions**. Upon receiving a **Transaction** request from the **Driver**, the **Sponsor's** code is responsible for calling DoTxn() on the appropriate **EGenTxnHarness** object (3a). After returning from the call to DoTxn() the **Sponsor's** code is responsible for sending the **Transaction's** output back to the **Driver**.

See EGen/inc/TxnHarnessBrokerVolume.h – TxnHarnessTradeUpdate.h.

The **Sponsor** is responsible for providing implementations for the following classes used by **EGenTxnHarness**.

- CBrokerVolumeDBInterface
 - CCustomerPositionDBInterface
 - CMarketFeedDBInterface
 - CMarketWatchDBInterface
 - CSecurityDetailDBInterface
 - CTradeLookupDBInterface
 - CTradeOrderDBInterface
 - CTradeResultDBInterface
 - CTradeStatusDBInterface
 - CTradeUpdateDBInterface
 - These classes are responsible for implementing the **Frames** invoked by **EGenTxnHarness**.
- CSendToMarketInterface is a TPC provided class that includes a pure virtual member function SendToMarket(). The **Sponsor** is responsible for subclassing CSendToMarketInterface and providing an implementation for SendToMarket(). This implementation is responsible for sending trade requests to the **Sponsor's** MEE implementation running on the **Driver**. A pointer to the **Sponsor's** implementation of CSendToMarketInterface must be passed into the constructor for the **EGenTxnHarness** objects CTradeOrder and CMarketFeed.

A.14 TPC Defined Interfaces

Appendix C. TPC-E XML SCHEMA GUIDE

C.1 Overview

The schema of the ES.xml document is defined by the XML schema document tpce-es.xsd (available from [www\(tpc.org\)](http://www(tpc.org))). The ES.xml file must conform to the tpce-es.xsd (established by XML schema validation).

C.2 Schema Structure

An XML document conforming to the tpce-es.xsd schema contains a single element named tpceResult of type RootType. Complex types are explained in the sections below. Simple types are not included here, but can be found in tpce-es.xsd.

C.2.1 The RootType consists of the following attributes:

Attribute	Type	Description
SponsorName	string	The sponsor's name.
ServerName	string	The name of measured server.
SpecVersion	SpecVersionType	TPC-E Specification version number under which the benchmark is published
PricingSpecVersion	SpecVersionType	TPC-Pricing Specification version number under which the benchmark is published
ReportDate	date	The date that the result is submitted to the TPC.
RevisionDate	date	The date that a revision is submitted to the TPC, if applicable; otherwise omitted.
AvailabilityDate	date	Availability Date (see TPC Pricing Specification)
tpsE	tpsEType	Reported Throughput in tpsE (see Clause 6.7.1)
PricePerf	PriceType	Price/Performance Metric (see TPC Pricing Specification)
Currency	CurrencyType	The currency in which the result is priced.
TotalSystemCost	PriceType	TotalSystem Cost (see TPC Pricing Specification)
AuditorName	AuditorType	The name of the Auditor who certified the result.
Cluster	ClusterType	"Y" or "N" indicating if the result was implemented on a clustered server configuration.
SchemaVersion	SchemaVersionType	The schema version, initially "1.0".

C.2.2 The RootType consists of the following elements:

Element	Type	Description
DBServer	DBServerType	The DBServer element contains information about the database server.
RunData	RunDataType	The RunData element contains information about the measured run.
Inventory	InventoryType	The Inventory element contains the system part list and pricing data.

C.2.3 The DBServerType consists of the following attributes:

Attribute	Type	Description
-----------	------	-------------

DBName	string	The name of the Database Management System (DBMS).
DBVersion	string	The version of the DBMS.
DBMiscInfo	string	Any miscellaneous information needed to indicate precisely which version of the DBMS was tested (e.g., "Service Pack 1" or "Build 1298").
OSName	string	The name of the Operating System (OS) on which the DBMS was running.
OSVersion	string	The OS version.
OSMiscInfo	string	Any miscellaneous information needed to indicate precisely which version of the OS was tested (e.g., "Service Pack 1" or "Build 1298").
ProcessorName	string	The processor name and type (e.g., "Intel Xeon 2.8 GHz")
ProcessorCount	positiveInteger	The total number of processors in the Database Server.
CoreCount	positiveInteger	The total number of cores in the Database Server.
ThreadCount	positiveInteger	The total number of threads in the Database Server.
Memory	decimal	The amount of memory (in GB) configured on the Database Server.
InitialDBSize	positiveInteger	Initial Database Size in GB
RedundancyLevel	string	The Redundancy Level as defined in clause 7.5.5.4.
SpindleCount	positiveInteger	Priced number of Durable Media (disks) on the Database Server.

C.2.4 The RunDataType consists of the following attributes:

Attribute	Type	Description
MeasurementInterval	TimeType	The length of the Measurement Interval in hh:mm:ss.
RampupTime	TimeType	The length of the Ramp-up in hh:mm:ss.
RecoveryTime	TimeType	The Business Recovery Time in hh:mm:ss.
MeasuredThroughput	tpsEType	The Measured Throughput.
TotalTxns	positiveInteger	The number of Transactions completed within the Measurement Interval.

The RunDataType contains the following elements:

Element	Type	Description
Broker-Volume	TxnDataType	Summary data for the Broker-Volume transactions.
Customer-Position	TxnDataType	Summary data for the Customer-Position transactions.
Market-Feed	TxnDataType	Summary data for the Market-Feed transactions.
Market-Watch	TxnDataType	Summary data for the Market-Watch transactions.
Security-Detail	TxnDataType	Summary data for the Security-Detail transactions.
Trade-Lookup	TxnDataType	Summary data for the Trade-Lookup transactions.
Trade-Order	TxnDataType	Summary data for the Trade-Order transactions.

Trade-Result	TxnDataType	Summary data for the Trade-Result transactions.
